THE

PHONETICS OF ARABIC
Printed in England
At the Oxford University Press
By John Johnson
Printer to the University
PREFACE

In the production of this manual the debt which I owe to one fellow-worker and friend goes far beyond the bounds of a preface-acknowledgement; for his work on this book has, in truth, amounted to virtual joint-authorship. Since, however, I must not join his name to my own on the title-page, I am fain to set it here, and to do myself the honour of inscribing my opusculum to

Professor Daniel Jones

of University College, London. Perhaps it is better so after all; for now the student may be sure that any error or misstatement in the book is just as certainly mine as any merits in its technique are probably Professor Jones's. The grist for the mill I of course supplied, and for it I am responsible. But how much of the milling has been his! And I cannot think of the lavishness and enthusiasm with which, to an extent which I could never have asked, he poured time and labour into the work of another man, without an admiration and gratitude which I find it difficult to express.

To the Rev. T. Grahame Bailey, the many-tongued of the Punjab, I was also deeply beholden for much help and encouragement in the earlier stages of the work, the first draft of which he saw as far back as 1912.

I desire to acknowledge here the profit which I derived from reading Mattson's Études Phonétiques sur le Dialecte de Beyrouth, a very valuable little book.

My thanks, also, to my colleagues, the Revs. E. E. Elder and C. C. Adams, of the American Mission, Cairo, for going over the whole book when ready for the press, and carefully checking its statements with their own experience and observations.

W. H. T. Gairdner.

Cairo, Christmas, 1924.

CHAPTER I

PRELIMINARY CONSIDERATIONS

To acquire a true pronunciation of any foreign language involves an entire revolution in our established habits of articulation. This is especially the case when the language to be studied is one, like Arabic, in which the pronunciation differs utterly from English and all other West European languages.

Every student must realize clearly from the outset that this revolution in speech habits must extend to the minutest particulars of pronunciation, and affects both vowels, consonants, and intonation. Even the apparent proximity of many of the foreign sounds to those with which we are familiar is really an added difficulty, for it makes it easy for us to stick to the familiar sounds through not noticing that they are different from the foreign ones.

The English student in particular must realize that he starts at a special disadvantage, when the language to be learned is Arabic. Compared with Arabic (and also some of the Continental European languages) the normal English method of articulation is characterized by a lack of energy. The lips and tongue do not perform such rapid or energetic movements in English as they do in French or in Arabic.

An important feature of English pronunciation, which is perhaps attributable to this lax method of articulation, is the feature often known as 'gradation', i.e. the reduction of vowels to a neutral sound (ə) in unstressed syllables. Such reduction does not occur in classical Arabic, and but sparingly in colloquial; and special care on our part is necessary to avoid introducing such weakenings into these languages.

1 Thus the words and, from, the, of, undergo gradation in the phrases two and six, he comes from London, the King of England.
Among other special difficulties we may mention here the existence in Arabic of a number of ‘throat’-sounds which do not occur in English, and the fact that the Arabic vowels are ‘pure’, whereas most of the so-called long vowels in English are diphthongic. These and other sources of difficulty will be discussed fully in the subsequent chapters.

In regard to the difficulty arising from the English laxness of articulation it may be remarked that the student who has had lessons in voice-production and declamation will find his knowledge of considerable assistance in connexion with the learning of Arabic. It cannot be insisted upon too often that right breath-management and the vigorous use of the articulatory apparatus such as is aimed at in declamation are just what is necessary for ordinary Arabic pronunciation.

It is further necessary to have an ear intensely on the alert to detect the intonation of the language; and so, to cultivate the faculty of mimicry. The word ‘mimicry’ is used advisedly: we need a stronger and more striking term than the usual word ‘copy’ or even ‘imitate’. A lady once told the writer that it was not until she plucked up her courage to mimic her French friends (it seemed most impolite to do so, and she quite expected them to take offence) that her efforts to speak French were greeted with applause, and they exclaimed, ‘Now that’s more like it!’

Some people have the faculty of mimicry and are quite unaware of what their articulatory apparatus (tongue, lips, &c.) is doing when they are imitating strange voices or sounds. With others the faculty is less developed. It is in connexion with the development of this faculty that the science of phonetics is particularly useful. Phonetics is the science which deals with the actions of the articulatory organs; by its aid we are able to give the student directions as to how these organs should be placed for the production of new sounds, how he may learn to get the organs into those positions, how to test the various shades of sound until just the right one is distinguished and fixed.

The object of this book then is to enable the student to supplement whatever natural mimicking power he possesses by that which he can cultivate from a knowledge of how
each sound is produced by the vocal apparatus. As soon as the student has acquired this knowledge, he will find that he can be experimenting and improving his pronunciation all day long. Phonetics is a science the experiment-laboratory for which is carried about by every one with him; and thus whole ranges of vowel and of consonant sounds can be gone over and tested sotto voce as he walks or rides abroad or sits in his study alone. All such exercise sharpens the sound-distinguishing sense and practises the sound-producing muscles.

A few further general hints may be given here.

(1) Use the eye as well as the ear. Observe people as they speak, and watch the teacher as he enunciates. Watch particularly the movements of the lips, the manner and extent of the uncovering of the teeth, the visible movements of the tongue. Be sure to have in hand, during the early lessons, a small mirror, so that you can compare the movements of your own lips, tongue, and jaws with those of the teacher. In many cases where the movements of the tongue are ordinarily invisible the tongue positions may be ascertained by inserting the finger or by measuring with a small ruler.¹

(2) Light is often thrown on the nature of Arabic sounds by observing the way in which an Arabic person speaks English. Such observations are particularly useful for learning to realize the differences between the Arabic vowel sounds and the similar English ones.²

¹ A small bone paper-cutter does very well for this purpose.
² The following is a good method of making the characteristic differences between similar sounds of different languages come vividly to light. Suppose the student is learning French and comes upon a French word that closely resembles, or perhaps at first seems to him identical with, an English word; let him construct an English sentence containing that English word; then let him request his French teacher to pronounce the similar French word when he says the English sentence, making a pause instead of the English word. Thus, if the English student pronounces incorrectly the vowel in such a French word as peur, let him pronounce ‘The cats... on the hearth’, requesting his teacher to insert the French word peur during the pause. The difference will then be glaring. In a similar way the student may be made to realize vividly the differences between such English words as here, house, and the similar German words hier, Haus, and between the English man and Arabic man (‘who’), &c.
(3) Speak out boldly and do not try to hide mistakes by mumbling the words. Speaking out well brings faults to the light of day and makes correction easier. George Borrow, who was a great practical linguist, said that in learning any new language he invariably spoke (1) loudly and (2) slowly. It is remarkable how often people attempt to follow exactly the opposite course.

(4) It is essential that the material collected in this book should be gone through with an Arab-speaking teacher, preferably a sheikh. The teacher should be regarded as a living phonograph who will translate the written examples of the book into audible, imitable sounds. It must be distinctly understood that this book is not intended to supplant oral instruction; its object is to supply a method according to which such instruction should proceed. The book-work should be studied carefully before each lesson, and the sheikh should be turned on like a phonograph to exemplify the various points.

Not only the method but also the perseverance and determination to succeed must come chiefly from the student's side. Most oriental teachers start with a conviction (perhaps an unconscious one) that it is absolutely impossible for a European to acquire anything approaching a correct Arabic pronunciation. It is for the student to make up his mind to demonstrate the falsity of that fixed idea, one consequence of which is that the teachers are often satisfied with the feeblest approximations to the Arabic sounds. The best way for a student to ascertain whether he really pronounces a sound well or not, is to mispronounce it purposely from time to time during his lessons. If the sheikh appears to be as well satisfied with the intentional mispronunciation as he is with the attempt at the real sound, the student may be certain that his attempts at the real sound are still considerably wide of the mark; and that his teacher needs some vigorous stimulating with regard to performing his duty properly.
CHAPTER II

THE ARABIC CONSONANTS IN GENERAL

'Voiced' and 'Unvoiced'.

The Arabic consonants, like the consonants in other languages, fall into a series of pairs, in each of which pairs one consonant is 'voiced' and the other 'unvoiced'.

As this distinction is fundamental and important its nature must be clearly realized, and for this purpose it must be understood what, physically and phonetically, is meant by 'voice'.

Voice is produced by the vocal chords, which are a pair of elastic ligaments resembling lips, situated in the larynx (the upper part of the wind-pipe). They are placed horizontally from the back of the larynx to the front, where they meet in a node which in males can be felt from the outside of the throat, the familiar 'Adam's apple'. The space between the chords is called the glottis. The glottis is opened by separating the inner ends of the chords, a V-shaped aperture being thus formed. The air from the lungs, which is passed through this aperture when fully opened, is called breath. When the glottis is half-closed and the breath has to pass through the smaller aperture, the frication thus caused produces the sound called whisper. But when the vocal chords are drawn close together and air from the lungs is forced between them, they are caused to vibrate very rapidly, and the vibrations produce the sound called voice. These vibrations can be felt by the finger, when pressed to the throat just under the node mentioned above.

It follows from this that voice is necessarily endowed with musical pitch. The pitch of the voice is made higher or lower by the tightening or relaxing, respectively, of the chords. Pitch is being constantly altered in speaking, just

---

1 Whisper is of different kinds, and the 'false vocal chords', which are just above the true glottis, contribute to one of these kinds.
as much as in singing. The marked rises or falls in pitch which accompany certain syllables in continuous speech are often called *accent* or *tone*. (As the term 'accent' has also been used to denote *stress*, it is better to refer to such pitches as *tone* or *pitch-accent* or *musical-accent*.)

The *unvoiced-consonants* are those which are produced without the co-operation of voice: as $f$. But the *voiced consonants* cannot be produced without the co-operation of

![Diagram of the organs of speech](image)

**Fig. 1. The Organs of Speech.**

voice: in passing from $fff\ldots$ to $vvv\ldots$, for example, it will be found that what has happened is just the *addition of voice* (The quantity of breath passed through the glottis is at the same time reduced, as less is needed for setting the chords into vibration.)

This may be tested. (1) *Stop the ears* with the fingers and prolong a $v$. When this passes into $f$ the humming sound (voice) immediately ceases. (2) For this reason it will be found that $v$ can be *sung*, $f$ cannot. (3) And if the *finger is*
pressed beneath the Adam's-apple node, it will be found that the vibrating ceases instantly when \( \nu \) passes to \( f \). Similarly for the pairs \( s \) and \( z \), and all the pairs which we shall study.

![Mouth Diagram](image)

- **a.** Gentle breathing.  
- **b.** Deep breathing.  
- **c.** Production of voice.  
- T. Tongue.  
- E. Epiglottis.  
- VV. Vocal chords.  
- W. Windpipe.  
- B. Bifurcation of windpipe.

Vowels in ordinary speech are all *voiced* as their name *(vocales)* denotes.

In *whispering*, what happens is that voice is eliminated, both from the vowels and the voiced consonants. The latter then become similar to their unvoiced correlative, except
that less breath is still used for them than for their correlatives. A whispered \( v \) or \( z \) resembles a very gentle \( f \) or \( s \) respectively.

The following are the pairs which are found in the Arabic consonants. They may be at once tried over with your pronunciation teacher in a preliminary way, before coming to the analysis of the sounds in the next chapter. The larger number of the pairs can be prolonged at will, in fact as long as the breath holds out, and these are therefore called 'continuants'. In the remainder a momentary action takes place, namely the release which terminates the stopping of the breath and of the consonant's specific sound. Such consonants are therefore called 'stop-consonants' or 'stops'. (This division into continuants and stops anticipates the more detailed classification of the next chapter.) The Arabic equivalents have been added above or below the corresponding Romic letters.

**The Arabic 'Continuants'.**

\[
\begin{align*}
\text{Unvoiced:} & \quad -^1 - f \theta - s \ \phi - - - j - x \ h \ h \\
\text{Voiced:} & \quad w \ m - d \ t \ z \ z^2 l \ t^3 r \ z^4 n \ q \ q -^5
\end{align*}
\]

**The Arabic 'Stops'.**

\[
\begin{align*}
\text{Unvoiced:} & \quad -^1 - t \ t - k \ q \ ? \text{ or ?}^6 \\
\text{Voiced:} & \quad b \ d \ \tilde{z} \ \tilde{z} \ z^7 g^8 - - \\
& \quad c \ j \ \tilde{c} \ d \ s \ (\text{or})
\end{align*}
\]

1 Where one of a pair is left blank, this means that the correlative does not occur in Arabic, or does not occur normally. The most obvious absentees for this list are \( p \) and \( v \).

2 Only in the colloquials.

3 Only (normally) in the name for 'God'.

4 Only in Syrian colloquial.

5 The voiced \( h \) (\( \tilde{h} \)) is heard from some speakers in place of \( h \).

6 When this sound stands for \( q \), as in Cairene colloquial, we shall represent it by \( ? \), i.e. with tail prolonged to the lower line.

7 Upper Egypt, Sudan.

8 Only in colloquials.
CHAPTER III

THE CONSONANTS CLASSIFIED

In addition to the division of consonants into voiced and unvoiced, they are classified fundamentally

(a) according to the manner of their articulation,
(b) according to the organs by which the articulation is effected.

All these classifications were well-known to the old Arab grammarians, the last section of whose works was a section on the phonetics of the consonants. Their analysis is of value to this day, and its results are embodied in this book: for, apart from details, the Arabic sound-system has not altered in the centuries. This is true as between the 'classical' language of those times and the same language on the lips of modern speakers. But it is no less true as between this classical language and the Arabic colloquials.

(a) In classifying consonants according to the manner of their articulation, the Continuants of the preceding chapter are subdivided as follows:

(1) *Nasal* consonants, in making which the breath escapes through the nose while the mouth passage is closed. Example, n.

(2) *Lateral* consonants, in making which an obstacle is placed in the middle of the mouth, and the breath is free to escape on one or both sides. Example, l.

(3) *Rolled* consonants (also called *Trilled*), which are formed by setting into vibration a slender elastic organ (specifically the tongue-point or the uvula), when held full in the breath-stream. Example, r.

---

1 For a glossary of some important Arabic phonetic terms, see p. 107. These may prove useful in lessons from sheikhs acquainted with orthoëpy (tajwid) as taught in the University of el-Azhâr to-day. Orthoëpy, or the science of correct pronunciation, was the sole object of phonetics with the Arabs: they wished to standardize the way in which the Korân should be recited.
The Consonants Classified

(4) Fricative consonants, made by forcing the breath through a very much narrowed orifice, the resulting sound being produced by the friction thus set up. Example f. N.B. Fricatives in which the friction is very feeble are often called semi-vowels: e.g. w, j.

The stop-consonants of the preceding chapter, from the viewpoint of this classification, are usually called

(5) Plosive consonants. Two parts of the organs of speech (e.g. the two lips) are held together and stop the breath. This action is the ‘stop’. When the obstruction is released and the air rushes out, an explosion takes place, causing sound. Hence ‘plosive’. Example, b.

(b) In classifying the consonants according to the organs which produce them, a complete phonetic order (which, it is hardly necessary to observe, is wholly independent of the English, or the Arabic, or the old Semitic order of the alphabet) is obtained. This order proceeds from front (the two lips) to back (the glottis), which constitute the two extremes between which all consonants are necessarily articulated.

This phonetic order is as follows: read from left to right.

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19
b m w f t d l θ ð s z t ð ʃ s ʃ n r
20 21 22 23 24 25 26 27 28 29 30 31 32
ʃ z j k ɡ x ɡ q ʃ h ?(7)

For convenience of reference the consonants are now given in the Arabic character and order, with their phonetic equivalents. Read from right to left.

1 The word 'with' must be understood to include both contact and approximation.
2 The blade is the part of the tongue just behind the point.
CHAPTER IV

THE CONSONANTS DESCRIBED

The Labials.

1. b Formed as in English. English students must be careful not to half-unvoice this sound when initial. The old Arabs were careful not to unvoice it when final, giving it a half-vowel to ensure voicing. But in colloquial it is partially or wholly unvoiced in this position when succeeding another consonant. Exx.: bint, hab.

2. m As in English. Exx.: man, fam.

3. w Formed as in English, except that more care should be taken over the rounding and protruding of the lips, especially when final, as aw. In the colloquial the less vigorous articulation of this combination reduces aw to the diphthongal au. Exx.: wizz, law. See photograph, p. 32, Fig. 7.

The Labio-dental.

4. f As in English. Ex.: laff.

The Dentals.

5. t, d These are true dental plosives: that is to say the tongue-blade does not, as in English t, d, come into contact with the alveolum or gum behind the upper teeth, but with the upper teeth themselves. The tongue-tip is turned down and can often be seen through the interstices of the teeth. See photograph, p. 16, Fig. 1.

6. It then becomes a gentle p. Nevertheless Arabic people experience considerable difficulty in pronouncing ordinary p-sounds, and are under the impression that the consonant does not exist in Arabic. See p. 53.
MOUTH POSITIONS

Set I. The Consonants t, s, s', l.

Fig. 1. [t]

Fig. 2. [s]

Fig. 3. [s']

Fig. 4. [l]

Fig. 5. [l']
The Consonants Described

Secondly, the contact is loose, not tight. The blade of the tongue is removed very gently as the air is released with a marked hiss. (This is called in Phonetics 'affrication'.) Arabic td are more strongly affricated than the normal English consonants. The hiss is most marked in closing a word.

These two vitally-important considerations result in sounds entirely different from the corresponding English ones.

7, \[1, 7\] The usual Arabic 1 is formed as follows. The tip of the tongue touches the upper teeth, the edges being pressed all round the teeth, while the front of

![Fig. 4. Dental ('clear') 1.](image)

the tongue is simultaneously raised in the direction of the hard palate. The air-passage being thus closed in the centre, the air escapes on one or both sides of the tongue (hence the term 'lateral').\(^2\) See photograph on p. 16, Fig. 4.

This variety of 1 is often called 'clear'. Its characteristic 'clearness' depends, it is most important to note, on the raising of the front of the tongue and the depressing of its back part.

Though the 'dark' variety of this consonant (t) belongs to the alveolar group, it is necessary to discuss it here, in

1 It is convenient to discuss these two sounds together.

2 According to the old Arab phoneticians it escaped normally on the left side. They say that in some speakers it escapes on the right. And one of them carefully records that in the case of the Caliph Omar (ṣumar) it escaped on both sides!
close connexion with \( t \). For \( t \) the tip of the tongue comes back, and now touches the teeth-ridge, the area of contact also being reduced: and at the same time the back of the tongue is raised towards the back of the soft palate or velum.

The distinction between clear \( l \) and dark \( t \) is a source of serious difficulty to some English, and still more to nearly all Scotch and American students. English people ordinarily, but by no means universally, use a clear \( l \) before vowels, but a darker \( t \) before consonants and finally. Thus the words *leave, feel, field, little* are very generally pronounced \( li:v, fl:t, fl:ld, litt \). On the other hand many Scotch and

![Fig. 5. Alveolar (‘dark’) \( t \)](image)

most Americans use a dark \( t \) everywhere, though perhaps not quite so velarized a one as \( t \) in Arabic *ṭṭāb* ‘Allah’. It is therefore absolutely necessary for each student to ascertain exactly how he pronounces his own \( l \), in order that he may know what to avoid and what to acquire in pronouncing Arabic \( l \) and \( t \). It is worth any trouble to get Arabic \( l \) correctly (the other gives few people any trouble), for it is incessantly occurring, and to turn it into \( t \), as unfortunately is habitually done by too many, is peculiarly offensive to Arab ears, as appears from the way this particular mistake is singled out for caricature.

Those who use \( t \) normally should realize that they will have great difficulty in pronouncing Arabic clear \( l \) when it is *final or followed by a consonant*; e.g., *fl:1 ‘elephant,’ sflt ‘I carried*’; or even as in *balad ‘country*’. The sound is
The Consonants Described

best acquired by placing the tongue in the i-position, pressing the edges to the front teeth and then prolonging an l-sound. When once a good clear l can be pronounced it is necessary to practise it assiduously in different combinations, e.g. il, el, al, ul, ilt, eld, &c.

The only place where t is recognized by the Arabs themselves as occurring in Arabic is in the Divine Name 'Allah' (except when i occurs as first vowel). Thus, uttāh, uṭṭūh: but līlāh 'to God.' But actually it frequently occurs in words where l is influenced by neighbouring velarizing consonants (see next section): e.g. ṭαṭαb 'a request', where t influences the next three phonemes and turns l into t; murtāt: 'Maltese', where the influence is regressive. And so jūṣṭab 'he is crucified' (t influenced by s). In ultra-careful reading the above words would doubtless be sounded ṭulab, juslab.

When l is final and succeeds a consonant, it is usually unvoiced in Egyptian colloquial. The character for unvoiced l is l. (The apparently difficult Welsh 'll' is simply l greatly strengthened by increased breath pressure.) In Syrian such words are pronounced with voiced final l, in fact a distinct vowel is often inserted between the two consonants. Ex.: Egyptian, riql, foot; Syrian, riql, rigel, or even rigel:1 Exxs. of l:—lādd, lidd, lubb, jīld, ẓalf, nūlt.

8, [θ, ð] θ and ð are the interdental fricatives (θ being breathed and ð voiced). In pronouncing them the tip of the tongue is placed between the slightly opened teeth. θ and ð are the sounds of th in the English words thin and then. They occur in literary Arabic but not in the colloquials. In the colloquials they have passed into t (or s) and d (or z) respectively.1 Exxs.: ẓamm, ẓamm, baṭṭ, ṣadd.

10, [s, z] The most notable difference between these 11. Arabic sibilants and the corresponding English ones, is that in Arabic the hiss is very much stronger and more sibilant than in English. So weak and indeterminate does our hiss often appear to Orientals that pronunciation teachers often annoy their pupils by accusing them of having

1 See Appendix, p. 31.
made θ instead of s. Similarly in z the buzz is stronger and clearer in Arabic than in English.

It is not possible to describe the exact position of the tongue-point in making this strong hiss. It will approximate to the speaker's natural s, but in such matters the differences are fractions of millimetres. Each student must experiment until he recognizes the exact position in which he can produce the clean, clear sibilance characteristic of Arabic s and z. But the position of the upper lip is also very important. It is lifted clear of the upper teeth, which are thus disclosed very much more markedly than is the case of English s, z. See Fig. 2, p. 16.

Exx.: sann, zaff, mass, hazz.

The (velarizing) Alveolars.

These are a group of consonants, ṭ, ṭ̄, t, ṭ, s, z, which differ from t, d, l, ṭ, s, z (respectively) after the fashion already described under l, ṭ̄: that is to say, the tongue-point is now alveolar, and the back of the tongue is raised towards the back of the velum, i.e. the extreme back of the palate. The tongue feels as if it 'fills the mouth'. This velarization was described by the old Arab phoneticians as a 'lidding'—they said that the tongue seems to fill the cavity above like a lid. When by experiment the student becomes conscious of the exact movement of the back of the tongue all these six consonants may be easily deduced from their correlatives. It will only be necessary to give one or two additional points of information below.

12. [t, ṭ] 4 The articulation of the tongue-point being alveolar, it is no longer seen between the interstices of the teeth. The upper lip, as with all their

---

1 Compare Fig. 4 with Fig. 5.  
2 Ar. ūbbaq.  
3 Ar. ṭ̄obaq.  
4 Original Arabic ṭ̄ was very differently pronounced and still is so in Arabia and Mesopotamia. It was pronounced laterally, against the (left) side teeth, with strong affrication. [This combination of velarizing with affrication (ʔ and lateralizing) doubtless characterized the correspondent Hebrew consonant š which is usually transliterated ts.] It was this sound, not ṭ̄, that the Arabs considered so difficult that they denied to foreigners the ability to pronounce it: and therefore called themselves 'The people who speak with ș'.
consonants, is laxer and more drooped. Exx.: ṭall, ṭall, butt, ṭadd.

14. [f] See above under l.

15. [t] The velarized correlative of Ṥ. In Egypt it is practically only heard in Koranic reading, being otherwise replaced by z, even in speaking classical. But further east it is commonly heard. Exx.: ḏunna, ḏudda.

16. [f, ζ] The velarized correlations of s, z. Note also carefully that the upper lip is not lifted as with s and z. It droops, or the lips are slightly rounded. Exx.: soff, sopp, liss, liss. See photograph on p. 16, Fig. 3.

The Alveolars.

18. [n] As English n. Some English people produce a very imperfectly nasalized n, which sounds as if the speaker had a cold. This must be carefully avoided. Exx.: nam, fann.

Rolled r.

![Fig. 6. Rolled r.](image)

19. [r] r is an alveolar rolled consonant, i.e. it is formed by a rapid succession of taps of the tip of the tongue against the teeth-ridge (Fig. 6). The Arabic r is identical in formation with the Scotch r, but it is not so prolonged: two taps of the tongue is sufficient.

The ordinary Southern English r¹ is unrolled, and the

¹ Denoted phonetically by Ṣ, when a special symbol is required. It is only at the beginning of a syllable that English letter r represents
acquisition of rolled \( r \) by those who only use an unrolled \( r \) sometimes requires considerable practice. Rolled \( r \) may be acquired by starting from unrolled \( r \) and pronouncing it with great force and with sudden jerks of breath, trying all the time to keep the tip of the tongue as loose as possible. Many students find it easier to roll voiceless \( r \) first.

Other well-known exercises are to pronounce \texttt{teda:teda:}
\texttt{teda:... or geda:geda:geda:...} with gradually increasing speed; when pronounced very fast they tend to turn into \texttt{tra:tra:tra:...}, \texttt{gra:gra:gra:...} with a single flap \( r \). When the mechanism of single flap \( r \) has been acquired, the sound may be extended to a fully rolled \( r \).

Students are specially warned against using the variety of unrolled \( r \) known as ‘inverted’ or ‘retroflex’ \( r \). It is a variety in which the tip of the tongue is curved back towards the hard palate. It may be observed in the American and South-West of England pronunciation of words in which \( r \) does not commence a syllable, as \textit{far, fur, work}.\(^1\)

When rolled \( r \) has been mastered, the student must be careful to use the sound properly in connected speech. It is particularly necessary to pronounce it distinctly when a consonant follows or when it occurs at the end of a word.

As we saw in the case of \( \frac{1}{2} \), \( r \) is found unvoiced, but still rolled, in Egyptian colloquial when final and preceded by a consonant, e.g. \texttt{sitr}, curtain.\(^2\) In Syria it is voiced, or a short neutral vowel is inserted between the two consonants.

\textit{Exx.: ruff, marr, fard.}

It is not too soon to warn English speakers that Arabic \( r \) has no lengthening influence on the preceding vowel. In the two above words \texttt{marr, fard}, for example, the \( a \) is quite short.\(^3\)

\(^1\) Some phoneticians deny that this ‘cerebral \( r \)’ is a consonant at all. These hold that it is a mere modification of the preceding vowel.

\(^2\) Unvoicing of \( r \) (or \( s \)) occurs in French under similar circumstances, e.g. in \texttt{quatre, coffre}, when final.
20. \(j, 3\) \(j\) and \(3\) are alveolar fricatives in which the tip of the tongue is a little further back and the front of the tongue more raised than for \(s\) and \(z\). \(j\) is breathed and \(3\) is voiced. The latter is only heard in Syria.\(^1\)

\(j\) is the English sound of \(sh\) as in ship; \(3\) is the medial consonant in pleasure. See p. 16, Fig. 5. Exx.: jamm, bafi.

**The Palatals.**

22. \(j\) This is the voiced plosive formed by raising the front of the tongue so as to touch the hard palate, midway between the contact-points of \(d\) and \(g\): for which reason, and because it is the stop-sound corresponding to fricative \(j\), it sometimes sounds to the ear like \(dy\), sometimes like \(gy\).

It might be conjectured that this is the original Arabic consonant. It is variously replaced in different parts of the Arabic-speaking world, the varieties ranging from \(d\) in front to \(g\) back. This is intelligible, as \(3\) is exactly central, and, as we therefore conjecture, original. In Cairo and Lower Egypt it is replaced by \(g\); in parts of Syria by \(3\).\(^2\) In the literary language (generally speaking) by \(d\).\(^3\) In remoter parts of Upper Egypt (and in Nubia) by \(d\). It is in the

---

\(^1\) In Egypt only as part of the group \(d3\), see below.

\(^2\) French \(j\) in jeu: in English as \(z\) in azure.

\(^3\) English \(j\) in jam. Correlative to this change from \(q\) to \(d\) is the change from \(k\) to \(t\) in some countrified districts of Egypt and Palestine.
Soudan and Upper Egypt generally that $j$ itself is heard. Thus the Arabic word for army is $\text{geo}$ in Cairo, $\text{geo}$ in Upper Egypt and Soudan, $\text{se}$ in Syria, $\text{de}$ (or more strictly $\text{daaj}$) in the Classical, and $\text{de}$ in the remoter districts. It will be seen that these variations form an intelligible series.

Fig. 9. $\text{d3}$.

Throughout this book $j$ will be uniformly written for the classical, $q$ for the colloquial, consonant ($\text{q}$); and it will be for the student to pronounce the variety that he chooses.

23. $j$ As English $y$ in 'yes'. In pronouncing $j$ the front of the tongue is raised towards the hard palate, leaving only a very narrow space for the escape of air. The tongue position is higher than that of the vowel $i$, just high enough to cause friction as the air passes through the narrowed orifice, though the friction and the resulting consonantal sound are so weak that this sound is often called a semi-vowel. Analogous circumstances are observable in the case of the other semi-vowel $w$ and its correlative $u$. It is at these two points, therefore ($j$ and $w$), that consonant passes into vowel. (See also p. 32.)

Just as we saw $aw$ is often weakened in the colloquials into the diphthong $au$, so $aj$ becomes $ai$. When it is necessary to produce $aj$ and not $ai$, the tongue must be sharply raised to the consonantal position so that a definite $j$ is produced. Exx. : $jad$, $bajn$, $lajj$. 
The Consonants Described

The Velars.

24; [k, g] The tongue positions are as in English. Arabic k is strongly affricated (see p. 17) when followed by a vowel, and notably when final.

For g see under j. Exx.: kaff, fakk, gass, lagg.

26. [x] If the syllables ik, ak, uk (as in English hook) be pronounced in succession, and the point of contact in the soft palate carefully noted in each case, it will be found that it recedes from front to back, being farthest back at uk. If the student then causes the tongue to approach any of these k-positions, but, before contact occurs, forces

the breath through the narrowed orifice, x will result. The result is as if one clears one's throat very far forward. When the student can produce the sound in isolation, he must practise it in different combinations, and more particularly with a vowel following. English-speaking students must be careful to avoid making complete contact of the tongue with the palate, which would produce k or sometimes a combination kx—a bad mistake. The sound is the same as the German ch in ach (but not the ch in ich, for this ch is, except in German Switzerland, a palatal fricative, the unvoiced correlative of j). The 'scrape', which is an essential of Arabic x, is due to agitation of the soft extremity of the velum by the breath forced through the narrow orifice.

Exx.: xud, duxt, muxx.
The Consonants Described

27. This voiced consonant is the nearest voiced correlative to \( x \), but it is not an exact correlative in Arabic, for no velar 'scrape' is heard. No attempt, therefore, should be made to articulate it like the guttural German \( r \). Rather is it to be identified with the North-German soft \( g \) in \( wägen \). If the student can pronounce the \( ch \) in Scotch \( loch \) correctly (not with velar scrape) and then voices that fricative, \( q \) results. Another plan is to think of the sound \( q \), but to pronounce lazily, so that the contact is not quite complete. Or listen to a very young baby saying \( ghoo \) (\( gu: \)). Exx. : \( gød, fugl, sabag \).

The Uvular.

Fig. 12. \( q \).

28. If the series \( ik, ak, uk \), is taken another stage further back, contact is made at the very extremity of the soft-palate and \( q \) results. To the English ear \( q \) is a retracted variety of \( k \), but to Arabs it is virtually as different from \( k \) as \( k \) is from \( t \), for in Arabic—as in Hebrew also—words distinguished solely by \( q \) or \( k \) bear wholly different meanings. The sound is replaced in most of the colloquials, e.g. by \( ?^1 \) in Cairene, \( q \) in Upper Egyptian and Sudanese, and a very energetic \( ?^1 \) in N. Syria. In Egyptian colloquial the sound

\(^{1}\) i.e. the glottal stop, see no. 32 below. Where the sound stands for an original \( q \) it will be represented by the longer-tailed \( ? \) : otherwise, by \( ? \).
The Consonants Described

q is not heard except in the word Qurʾan Korān. Exx.: qad, daqq.

Pharyngals.

29. [h] This is a pharyngeal unvoiced fricative, formed further back and lower down than x, and entirely without velar vibration. This point is vitally important, for the least suspicion of 'scrape' turns h into x, a change which may change the meaning of an Arabic word into one that is utterly—sometimes disastrously—different. (It is probable that in forming it the epiglottis descends, leaving only a narrow passage past the 'false vocal chords', through which the air is forced.)

We are faced with two difficulties in regard to the two pharyngals h and ḥ. In the first place it is very difficult to observe the formation of the sounds, and in the second place the knowledge of the manner of their formation is not of much help to the learner owing to the difficulty of feeling and controlling what goes on in the pharynx. The difficulties are even greater in the case of the sound ḥ, which will be described next.

h may be learned by observing that it is practically the same as what is known as 'stage-whisper' in English. All the student has to do is to put his mouth into the position of one of the opener vowels, preferably the sound o: as in saw, and whisper this vowel as strongly as he can. Another method is to pronounce an ordinary h as in hot, prolong it, and try to tighten the pharynx during its production, increasing the expulsion of air at the same time.

The sound h is by no means difficult to pronounce by itself, but requires practice to be able to put a vowel after it, and still more to put a vowel before it. It is necessary to practise very slowly at first, pronouncing h (as directed in the preceding paragraph) and then a vowel, say a, quite separate from it. Then the two sounds must be gradually brought together, thus: h—a, ḥ—a, h—a, ḥ—a. Similar exercises must be practised with other vowels, and with vowels preceding the sound h. Exx.: ḥann, laḥḥ.
30. $\hat{i}$ is generally regarded as the voiced correlative of $\hat{h}$, and this is partially true, for if $\hat{q}$ is unvoiced, $\hat{h}$ is found to result. But in voicing $\hat{h}$, it will be found that the general tenseness in the pharynx is notably increased, and it is probable that there are other physical modifications also. The student should try voicing $\hat{h}$ first. He will find that the voice-pitch which naturally results is a very low one, resembling a sort of growl rather than a musical note. In fact the following direction has been suggested: 'Sing down to your bottom note—and then one lower.' The sound that results is the basis of the $\hat{q}$. Thus (e.g.)

\[
\text{[lowest musical note]}
\]

and so the following exercise (on $ah$) may help in the production of this consonant:

\[
\text{[exercise]}
\]

Thus, in passing to $\hat{q}$ from a preceding vowel the voice has to descend rapidly, often through more than an octave, and is cut off at its lowest pitch. If a vowel follows, the pitch begins at its lowest and rises quickly, through a similar interval, to normal vowel pitch. Exx.:

\[
\begin{align*}
\text{[exercise] } & = \alpha \hat{q} \\
\text{[exercise] } & = \hat{q} \alpha \\
\text{[exercise] } & = \alpha \hat{q} \alpha
\end{align*}
\]

When $\hat{q}$ is final and preceded by another consonant (as in man$\hat{q}$ 'prevention') a hardly audible grunt is all that is produced, being merely a momentary touch below the lowest note the voice is capable of producing, thus $\hat{q}$.

The consonant $\hat{q}$ is not necessarily an ugly sound. On the contrary this momentary lowering and raising of the pitch of the voice when $\hat{q}$ occurs between vowels produces

\[\hat{q}\]

\[^1\text{Women speak, on an average, about a 'sixth' higher than men.}\]
The Consonants Described

a liquid gurgling sound, which, if properly executed is quite the reverse of unpleasing. Final ḳ is harsher to the European ear. When shouted in anger or excitement, the consonant may have an ear-splitting effect which carries long distances.

The student may try eliminating voice from ḳ; ḥ should result, if at the same time the force of the breath is increased. It is worthy of note that ḥ is sometimes substituted for ḳ in Egyptian colloquial, when followed by an unvoiced consonant, e.g. bitaḥti ('mine') for bitaḳti.

Exx.: ḳali, maḳa, ḳan, daḳ, manḳ.

The Glottals.

31. ḥ is the sound produced when the glottis is wide open, the pharynx uncontracted, and the mouth in the position for any vowel-sound.

All varieties of ḥ have one feature in common, namely, the wide-open glottis and pharynx. For this reason it is customary to designate ḥ-sounds by the term 'glottal fricative', and it is interesting to notice that it was classified by the Arabs as among the glottal sounds.

It is possible to produce a voiced consonant corresponding to ḥ. The phonetic sign for it is ʕ. It is formed by causing the vocal chords to vibrate as for voice, but by using a larger quantity of air than is necessary for voice only; the superfluous air produces a certain friction in the glottis which can be heard in addition to the voice. The effect is that of a kind of groan. The normal ḥ-sound in English is unvoiced, but voiced ʕ is sometimes used between vowels, as in comprehend. In Arabic, too, ʕ may be heard as variant of ḥ. Thus duhn or duḥn ('oil') are alternative pronunciations.

The effect of voiced ʕ is particularly noticeable (if used at all) in final position, or when followed by a consonant, as above. Both ḥ and ʕ are difficult for English people to pronounce when they occur in final position, or when followed by a consonant, since they do not occur in English in these positions. The best way of practising such syllables as ah, uh is to imagine that a vowel is going to follow: thus the student may start from aḥa, uḥu, iḥi, and gradually diminish the length of the second vowel until it disappears entirely. Exx.: ḥadd, ṣḥn, biḥ, faḥm, waḥ (waḥ).
32. ? is the plosive consonant produced by completely closing the vocal chords and then suddenly separating them. It is often called the 'glottal stop'. From its nature it cannot be voiced: for it is impossible simultaneously to produce an explosion, and a vibrating, from the vocal chords.

The glottal stop is prefixed by many English speakers to words which are generally considered to begin with vowels, particularly when the vowel is strongly stressed. Thus many would prefix it to the word our in the sentence 'It wasn't our fault', if the word is pronounced with emphasis. The sound may likewise be observed when a person pronounces the names of the English letters a, c, i, o, rapidly and staccato, one after another; the ? has the effect of separating the vowels from each other. This is what was meant by the old term 'hiatus' in this connexion.

The sound is easy enough to make by itself or when followed by a vowel. In Arabic it can equally occur before a consonant, and finally. When initial it is considerably weaker than in other positions.

The glottal stop is used as a substitute for medial t (as in water, fortnight) in many English dialects, including those of London, Edinburgh, and Glasgow. An exaggerated ? is the explosive sound heard in coughing; a ? might, therefore, be described as a very slight cough.

In French it is seldom heard, words like âme, on (i.e. those which 'begin with a vowel') being pronounced with open glottis (the 'smooth breathing' of Greek). In German, on the other hand, words which 'begin with a vowel' in reality begin with a very vigorously pronounced consonant, namely ? : e.g. ?alt, ?an, &c. The same is usually the case in English, though the plosion is much less noticeable in English an than in German an.

It follows from this that in Arabic (as in Hebrew, where ? is the 'aleph') no word begins with a vowel. Words written in English letters like akbar, abu, are really pronounced ?akbar, ?abu, but with weak plosion, as in English.

The sound ? is known to the Arabs as hamza ('compression', i.e. of the larynx), or more fully hamzatu 1 qaf?
'the hamza of cutting' (i.e. separating), because of the 'hiatus' made by the closing of the vocal chords and the stopping of voice and breath. This Arabic description of the sound suggests a final hint of great practical importance, namely, that wherever \( ? \) occurs, voice and breath must be entirely 'cut off' for a moment. For example, \( ?a{l} \ ?a{b} \) 'the father', can only be prevented from passing into \( ?a{l} \ _a{b} \), by entirely cutting off voice and breath after \( ?a{l} \). Exx.: \( ?a{b}, \ la{?,} \ ba{d}{?} \).

**Appendix (see p. 19).**

*On the change, in colloquial, of*

\[
\begin{align*}
\theta & > t \text{ or } s \\
\delta & > d \text{ or } z \\
\tilde{\theta} & > \tilde{a} \text{ or } \tilde{z}.
\end{align*}
\]

It is rather puzzling, and an exception to the laws which usually obtain in such cases, that Arabic interdentals undergo change in colloquial along two parallel and alternative lines, and become (a) dental-plosives or (b) sibilants. The explanation is probably this:—the true spontaneous change was to dental-plosives; the sibilants being probably the result of an attempt to classicize, i.e. to imitate the interdentals of literary Arabic, on the part of semi-educated people. This explanation is supported by an observation of two constant facts: that, *within the same root*, the words with sibilant change are less common and more literary than those with plosive change; and that the more countrified the speech the more the former gives way to the latter. Exx:—

CHAPTER V

THE ARABIC VOWELS IN GENERAL

We have already seen, in discussing 'voice', that voice is the basis of all vowels, as it is of some consonants (p. 11). Further the articulation of the vowels, just as of the consonants, is due to the different positions of the tongue and lips, which modify the voiced breath-stream, as it passes from the lungs into the air, by creating for them resonance-chambers of different sizes and shapes.

It is possible to unvoice vowels. When this is done they cease to be vowels in the true sense of the word, but the tongue and lip positions remain the same, and the essential vowel-differences, caused by the different resonance-chambers, remain unaffected by the absence of voice. Indeed, the quality of vowels may best be tested by whispering. Students are recommended, for instance, to whisper the sounds i, a, u, observing (1) the movements of tongue and lips, and (2) the pitch-characteristic of each sound; it will be found that the pitch clearly descends from i through a to u.

From Fricative Consonant to Vowel.

In the preceding chapter we noted that at two points consonant passes into vowel. One of these is where the palatal fricative j is slightly lowered, so that the friction made by the air passing through the orifice is gradually reduced to zero, and the vowel i results. This is one of the two extreme or 'narrow' vowels. The other is u. In an allusion to this vowel in the previous chapter we were only considering its lip articulation, which approximated to that of the semi-vowel w. But its tongue position must now be noted. It is velar. The back of the tongue is raised till it approximates to the g position, but is kept just low enough to allow of friction being reduced to zero, when u results.

1 In some languages j and w are not recognized as consonants at all, and are spelt as vowels: e.g. Fr. ouest, ouadi.
MOUTH POSITIONS

Set II. The Vowels (normal values)

Fig. 6. [u]

Fig. 7. End of Arabic diphthong [au] ([aw])

Fig. 8. [o]

Fig. 9. Arabic [a] (normal value)

Fig. 10. [e]

Fig. 11. [i]
This high-tongue position is not so easy to test by feeling as is the case with i; but with care it can be satisfactorily tested.

In i and u, therefore, we have the two extreme, or narrow, vowel-positions, the raised part of the tongue in i being the fore part, in u the back. If the tongue is gradually lowered from the first position, a series of vowels called 'front' vowels is obtained, the principal (Arabic) ones of which are denoted in this book by the characters e and a. If the tongue is gradually lowered from the second position a series of 'back' vowels is obtained, of which those that occur in Arabic are denoted by the signs о and у. If the raised part of the tongue is central, a series of vague vowels is obtained, of which those that occur in Arabic we denote by the signs ą and ę. Finally, when the tongue lies as low as possible and the passages are made as open as possible, the open a results. Thus a, i and u are the three extreme and fundamental vowels, and might be diagrammatized as a sort of inverted triangle, with apex low at a, and raised base i–u. The other vowels would thus be arranged along the sides a–i and a–u, or up the middle.2

1 We shall nevertheless abandon the diacritic dot as superfluous, for reasons given on p. 37.
2 For a more precise schematization, see p. 38, and the diagram there given.
Vowels have a secondary lip articulation. Open a is accompanied by wide open lips; the narrower vowels i and u by an opening which is as narrow as possible, with this difference, that in the case of i the lips are slightly spread, in the case of u notably rounded (as in the position of w). (These particular combinations of lip- and tongue-positions are not the only possible ones. But they are the natural and the usual ones, and they are the ones universally found in Arabic.) See the photographs on p. 32.

This phonetic and physical fact of three fundamental vowel positions is reflected in the very structure of the Arabic language and character: for the three cases of that language are inflected by means of these three vowels; and, in the character, signs are provided for these three alone. The different varieties of a-sound (ı, a:, ā, a) are not recognized by the Arabs as having any significance in Arabic: and o and e are not recognized, because they do not occur in the classical, but are merely colloquial correspondents to the diphthongic aw and aj respectively. But since the subject of this book is the phonetics, not the grammar, of Arabic, and since it takes into account the colloquials, it becomes quite necessary to distinguish all these vowels by signs. (We see in this one of the reasons which make the Arabic character unsuitable for the study of the colloquial.)

The Arabic names for the three fundamental vowels are as follows:

For the a-vowel fathā ‘opening’, so called from the openness of the air-passage at throat and lips;

For the u-vowel dāmma ‘gathering-together’, describing the position of the lips;

For the i-vowel kasrā ‘breaking’, so-called either because the free passage of the breath is broken by the narrow tongue-position, or from the fissure-like position of the lips.

Apart from this, the Arab phoneticians took no interest in the vowels, and we lose their further guidance in the matter. It is only possible to guess, by inferences from chance allusions in their works, what were the exact phonetic values of the old Arabic vowels, how far variations occurred, and
how far the vowels of those days coincided in value with those of to-day, or varied therefrom.

‘Long’ and ‘Short’ Vowels.

The differences in vowel-sounds that have been described so far are differences in quality, produced by varying the positions of the tongue and lips. It is the exceedingly great variety of these possible positions which makes possible the very large number of different vowels when all languages are considered; as well as the innumerable nuances of dialectic or individual peculiarities. But vowels may also differ in quantity, that is to say, in the duration of their prolongation. Generally speaking, ‘long’ vowels are sounded for about twice as long as ‘short’. For example, the a-sound in father takes about twice as long as that in fatter. The i-sound in bead is about twice as long as that in beat. In classical Arabic this proportion is definitely recognized, and is accurately maintained in the most polished style of reading.

The sign for prolongation employed in this book is: after the vowel. Thus, faːðə = ‘father’.

English and Arabic Vowels compared.

Before coming on to the description of Arabic vowels it is important to notice how fundamentally, in one respect, the English system differs from the Arabic: namely, that when the English\(^1\) prolong a vowel-sound they nearly always change the position of tongue, or lips, or both, at the end of the sound: in other words their ‘long’ vowels are ‘diphthongized’.\(^2\) In Arabic, tongue and lips are held absolutely steady from start to finish, In other words Arabic long-vowels are ‘pure’.

This important difference may cause trouble at first; but it is absolutely necessary to keep these Arabic vowels pure, as our method of gliding from one position to another in lengthening vowels is very distasteful to the Arab ear and

---

1 But not the Scotch, nor some Northern English. The Americans are divided.

2 The long vowel in do is really uː, in see iː, in say ei, in low ou, in scarce œ.
The Arabic Vowels in General

lends itself painfully to caricature. It is curious what difficulty some English people have in holding tongue and lips motionless from beginning to end of a vowel sound. But to make the effort definitely is to succeed.

The Arab boy has a really much harder task to diphthongize his pure vowels in speaking English, and to do so to the nuance of accuracy that is necessary. One reason which makes most English-speaking by Orientals so foreign is that they do not diphthongize their vowels, or do so incorrectly. And their English teachers often have no standard, and no notation, wherewith to describe and fix these nuances.¹

Nasalizing of Vowels.

The nasal timbre is produced by the failure of the soft palate to block the nasal cavity completely. (This complete blocking takes place every time a vowel is sounded by a non-nasalizing speaker.) The result is that the air in the nasal cavity is thrown into sympathetic vibration, and breath passes through the nose as well as the mouth. The French fully nasalize some vowels. Most Americans partially nasalize all vowels. But by both, the greatest pains must be taken to eliminate nasalizing entirely in speaking Arabic, as the effect of it in Arabic is very marked and very unacceptable.

¹ For the sake of completeness it may be added here that in the consonants the chief failures of Arabic speakers of English are as follows: 1 instead of ž; dental t too strongly affricated, instead of the English alveolar plosive; strong instead of weak sibilant s; and the use of ⁹ before all words beginning with vowels, instead of joining those words to the preceding ones. These hints may prove useful for English teachers of English to Orientals.
CHAPTER VI

THE VOWELS DESCRIBED

Some of the phonetic characters employed for the vowels in this book are used with values somewhat different from their 'cardinal' values. Thus Arabic a is nearer the sound represented in the International Phonetic Alphabet by æ than it is to the a which represents the cardinal vowel in French page. Again, the short Α (the vowel-sound in English bud) we represent by a. We employ a rather than æ because it is far the commonest Arabic a-phoneme. And we employ α instead of Α or ἀ because it is the short vowel which regularly corresponds to the long vowel α:; and, though not identical, is very near Α in quality. We thus save a symbol. The following equations for the α-phoneme, therefore, may be noted at the outset by those familiar with the 'cardinal' positions, and the I. P. A. notation:

\[
\begin{align*}
\text{In this book} & & \text{I. P. A.} \\
\text{a} & \text{resembles} & \text{æ} \\
\text{α} & \text{always short} & \text{Α} \\
\text{α:} & \text{always long} & \text{α} \\
\text{D} & & \text{D}
\end{align*}
\]

For an account of the 'cardinal' vowel-positions and their sound values the student is referred to books on general Phonetics. Since they serve as a norm to which all vowel-positions and vowel-values may be referred, it is obvious that a precise theoretical and experimental knowledge of these cardinal sounds is of supreme utility for determining all other vowels, in whatsoever language. It might be mentioned here that the cardinal sounds may be heard in gramophone records ('His Master's Voice' series, No. B. 804).

In the following diagram, kindly prepared by Professor Daniel Jones, the positions of the cardinal vowels are shown together with the approximate relative positions of the Arabic vowels. The black dots represent the tongue-positions
of the cardinal vowels, the circles representing the tongue-positions of the Arabic ones. Where the two coincide (⊙) it means that that Arabic vowel does not differ from the cardinal one.\(^1\) Where they differ the signs are apart.

We shall now describe the Arabic vowels, beginning from the close front position and passing down and up the two sides of the vowel-figure till we reach the close back position.

![Diagram of vowel positions](image)

\(\bullet\) = Cardinal vowel. \(⊙\) = Arabic vowel.

Fig. 15. Tongue-positions of the Arabic Vowels compared with those of the Cardinal Vowels. *For the lip positions see the photographs on p. 32.*

At the conclusion of the description of the vowels we shall deal with the diphthongs.

1, [i(\(\text{i}\))] In Arabic, as in English, there are two 1 a. varieties of i-sound, a closer one which is generally long, and an opener one which is always short. Thus the relation between the Arabic vowel in *sin* (‘the letter S’) and that in *sinn* (‘tooth’) is similar to that existing between the English vowels in *seen* and *sin*. As the use of open i in Arabic follows a regular rule, it is not necessary for practical purposes to use a separate phonetic symbol for it.\(^2\)

The Arabic long i: is cardinal i. It is identical in quality (though not in quantity) with the French vowel in *lit*. It is similar to the English vowel in *sheep*.

---

\(^1\) Except in the case of \(\text{a}n\), where the tongue-position is that of cardinal \(\text{a}\), but with the addition of some lip-rounding.

\(^2\) The International Phonetic symbol (for use in cases where it is essential to mark the difference between tense and lax i) is \(\text{i}\).
Many English speakers, as we have already seen, diphthongize to some extent the so-called English long ıː. The tongue, instead of remaining in one position throughout the sound, moves upwards towards the position ı. This diphthongization is particularly noticeable in words like see, key, where the vowel is final. English people who pronounce in this way must be careful not to do so in Arabic. The Arabic long ıː is perfectly pure, except in less refined colloquial,¹ and the student must practise repeating it until he can pronounce it without the slightest motion of tongue or jaw.²

The Arabic short ı (I. P. A. i) which is used when followed by a consonant terminating a syllable, is identical with the English vowel in 'sit'. Open short ı is somewhat closer. All long ı sounds are close.

When the short (open) ı is followed by the velarized consonants (tʃ, ś, &c.), the vowel tends to be modified in the direction of the mixed position,³ and a more obscure sound results. This modification in the vowel is only an incidental result of the passage of the tongue from the close front position of ı to the raised back position required for the velarized consonants. The speaker undoubtedly aims at pronouncing a true ı, as is shown by the fact that with the long vowel no such modification takes place: only a glide-vowel is heard, leading to the consonant (see below).

* Examples of modified ı.

<table>
<thead>
<tr>
<th>Modified</th>
<th>Contrast</th>
</tr>
</thead>
<tbody>
<tr>
<td>ıːsɔ  'robber'</td>
<td>ıss</td>
</tr>
</tbody>
</table>

When the ı is long and is succeeded by one of these velarized consonants or by q, x, g, h, q, a glide-vowel is heard ⁴, resembling the a-sound in English up. Thus mːh  'swell'

1 Thus in Cairo fj may sometimes be heard for fl, and so फर्खि for फर्खि.
2 The fact that the Arabs employ their sign for i to denote the prolongation of ı should not mislead us into supposing that they diphthongize the vowel or close it by a consonantal ı.
3 i.e. towards the sound represented in international phonetic notation by ı. ı is a sound exactly intermediate between ı and ʊ (unrounded u)
4 In Hebrew this glide is definitely recognized as a vowel, called the 'furtive' pataḥ.
sounds rather like riːh. And so for the others, e.g. əː Overflow’. To labour this, however, would be to exaggerate. The proper pronunciation of the consonant will produce quite as much glide as is necessary. When iː or i is preceded by a velarized consonant there is no perceptible modification of the vowel, but an incidental passing vowel resembling a very short ə is perceptible. Exx.:

ṣːiːn ‘China’, and contrast siːn ‘the letter s’
ʃːiːn ‘mud’, ːiːn ‘figs’.
ʤːiːd ‘against’, ːiːd ‘didd’

2. The e of Egyptian and other colloquials has the value of cardinal e. The sound is usually found prolonged, being a development of the diphthongic ai. It does, however, occur short when followed by two consonants. (It does not occur in literary Arabic.) Exx.: bɛːt ‘house’, bɛtːə, ‘our house’.

This vowel is very near the French é in thé, and the German sound ee in Heer. It does not occur in Southern English, its place being taken by a diphthong of the type ei or eiː: thus dei or dei ‘day’. Northern English and Scotch people, however, pronounce the vowel pure: thus, deː ‘day’.

Those who diphthongize should determine what kind of sound they make in pronouncing words like day, play, game. They will probably find that the first element in their diphthong is lower than cardinal e. In practising the Arabic sound eː it is necessary (1) to see that there is no motion whatever of tongue or jaw, (2) to make the sound nearer ː than the English person is naturally inclined to make it.

When eː or e are preceded or followed by the velarizing and other modifying consonants, phenomena may be observed similar to those noted under iː i, but less marked, as might be expected. After ə (e.g. əːd) the rounding necessitated by the consonant is carried over to the vowel.

3. aː Lowering the tongue till it lies nearly flat in the mouth we reach the commonest of all the Arabic vowels, denoted in this work by a. In sound and in position it is very near to the English vowel in man (I. P. A. æ). The subtle difference may best be appreciated by the ear.
MOUTH POSITIONS

Set III. The Arabic a-phoneme

(Note. All practically identical in lip-position)

Fig. 12. [a]

Fig. 13. [a]

Fig. 14. [A]

Fig. 15. [D]
if an Arabic speaker is asked to fill in the Arabic word man (مَنِ ) in the sentence 'Every man is mortal', the student saying the rest of the sentence audibly. Phonetically this means that in Arabic a the highest point of the tongue is a little further back than in English man (I. P. A. æ), in the direction of the sound in English bird (I. P. A. ə).

It is to be further distinguished from English a in man by the following: (1) in Arabic a the tongue is less lax than in English, because (2) its point is held in firm contact with the lower teeth, which is not the case with English æ: further (3) the lips are widely separated. (Let all rigidity, however, be avoided: everything is flexible, but steady.) Exx.: bal, baːl.

It is even more necessary to observe these directions when the vowel is prolonged (aː), for otherwise English students find a great difficulty in pronouncing aː: which is one of the commonest and most sonorous sounds in the language. There are two typical mistakes which one hears in student after student:

(1) English æ: (in bird) is substituted: the cure for this is to flatten and front the tongue more, and to open the mouth properly (see photograph on p. 32, Fig. 9);

(2) The diphthong heard in Southern English bear (phonetically beə) is substituted: the cure for this is to steady the tongue against the teeth and hold it absolutely still till voice is cut off and the vowel ceases.

These mistakes are attempts to avoid the ordinary Englishman's version of the sound which is the aː of father.

There is no sound resembling Arabic aː in French or German. German long a is near to the aː of father. The French long a in page is half-way between Arabic aː and English aː. It is heard in the Sudan, e.g. saːkiːt ‘plain’.

4. placeholders

Practically as the long vowel in English father. Tongue low down, but with the tongue-point withdrawn a little from the lower teeth. Mouth well open as with aː. This vowel is only found long. Exx.: baːt.1

1 It cannot be denied that various nuances are heard for these long modified a-sounds. For example with some speakers the a in man ‘fire’
5. Nearly as the short vowel in English *what.* (Americans pronounce this word differently, and for them this illustration is misleading.) Tongue flat, but with the back of it beginning to rise a little. In prolonging this vowel the quality must not be altered in the least. The tongue must not be made tenser, nor the mouth-opening contracted, however slightly, which two changes take place in English when this vowel is lengthened (*what*—*saw*). Arabs speaking English overdo this difference and pronounce *saw* (so; which is nearly so:) as so:. Exx.: *tobb,* *tobh.*

6. The o of Egyptian and other colloquial is usually found prolonged, being derived from a diphthongic *au:* it does, however, occur short when followed by two consonants. It does not occur in the literary language. This vowel is almost identical with the French sound of *eau* in *beau* and the German sound of *oo* in *Moos.* After the velarizing consonants (*t, d, s, z, ç*) it is somewhat lowered. The sound does not occur in S. English, its place being taken by a diphthong of the type *ou,* when, however, the first element is not so raised as Arabic o. In Scotland and Northern England this vowel is pronounced pure, and is closely similar to Arabic o. (For lip-position see photograph, Fig. 8).

English students should observe, by ear and by eye (in a mirror) what sound they actually make in pronouncing words like *go,* *home.* They will observe that the lips close just at the end of that sound. In Arabic (1) this slight motion must be entirely eliminated; tongue, lips, or jaw must throughout be kept perfectly still: and (2) the lips must be very well rounded and protruded. Exx.: *mot,* *motna,* so:t, sotna.

7. *u,* *u.*

In Arabic, as in English, there are two varieties of *u*-sound, a closer one which is generally long and an opener one which is always short. Thus the difference in quality between the Arabic vowels in *futt* (‘*pass!*’) and *futt* (‘I passed’), is similar to that existing in English between will be pronounced much nearer *a:,* perhaps nearly equal to the vowel in French *page.* See also p. 47, last paragraph.
the vowels in *boot* and *foot,* or *flute* and *put.*\(^1\) As the use of lax \(u\) in Arabic follows a regular rule, it is not necessary for practical purposes to use a separate symbol for it.\(^2\)

The Arabic long \(u:\) is almost identical in quality (though not in quantity) with the French vowel in *tout.* It is similar to the English vowel in *boot.*

Many English speakers diphthongize to some extent the so-called English long \(u:\); the lips, instead of remaining in one position throughout the sound, are gradually drawn together towards the position \(w\). This diphthongization is particularly noticeable in words like *too,* *blue,* where the vowel is final. English people who pronounce in this way must be careful not to do so in Arabic. The Arabic long \(u:\) is perfectly pure, and the student must practise repeating it until he can pronounce it without the slightest motion of the lips or \(\mu y\). See photograph, Fig 6.

The Arabic more open \(u\) may be taken to be identical with English \(u\) in *put.* It is always short. It is most clearly heard in a syllable closed by a consonant, the short open vowel being slightly closer and more rounded. Exx.: \(\delta u:\), *kun,* *rumu.*

*The Vague Vowels.*

8. \(\alpha = (\Lambda)\) This short vowel is approximately the English vowel in *up.* Phoneticians are not agreed upon its precise tongue-position: but the sound is so easy to English-speakers that it is unnecessary to discuss the question. In Arabic it is always short and is used in correlation with the \(\alpha:\) as in *father,* which is always long. This would seem to be a proof of the close phonetic relation between the two, that is between English \(\alpha:\) and \(\Lambda\). The latter would appear to be a central variant of the former, somewhere towards the position of \(\varepsilon\). For these reasons it seemed unnecessary to give it a separate symbol. The mouth-opening is the same—a statement which applies also, it should be carefully noted, to \(a\) and \(\nu\).\(^3\) Exx.: *baxt,* *bagda:d.*

\(^1\) Many Scotch people do not make any distinction between such words.

\(^2\) The international phonetic symbol (for use in cases where it is essential to mark the difference between tense and lax \(u\)) is \(\upsilon\). The rule is exactly the same as that given for \(i\) and \(i\), *mutatus mutandus.*

\(^3\) See photographs, p. 40.
9. This, the vaguest of the vowels, is similar to the vowel in French \( \text{le}, \text{le} \). It is not, properly speaking, a classical vowel, but it is frequent in the colloquials, (1) in rapidly and vaguely pronounced unaccented short vowels, and (2) as a substitute for short \( \text{a} \) at the end of words. Parallels to each use may be found in other languages, e.g. (1) the first vowel in \text{parade, Macaulay} ; (2) the final vowel in \text{Ada}, and German final \( \text{e} \) as in \text{eine (aîne)}. Exx. : (1) \( \text{m̄h} \text{ammad}, \text{m̄sa} \text{fir} \) (originally, in both cases, a short \( \text{u} \)) ; \text{wa} \text{h̄ide}, \text{mi} \text{ne}, \text{k̄ne}.

Note. (1) The velarizing consonants resist this obscuring of final \( \text{a} \) : e.g. \( \text{ḡoli} \text{sun}, \text{not ḡoli} \text{se}, \text{he} \text{to}, \text{not he} \text{to} \); (2) In Palestine and Syria, for final feminine \( \text{a}, \text{i} \) is used,\(^1\) not \( \text{e} \) as in Egypt, e.g. \( \text{t̄nujji} \text{bi} \) ‘good’ (f.), where in Egypt \( \text{t̄nujji} \text{be} \) is heard. A half-way approximation to this is heard in some districts of Lower Egypt, where this word is pronounced \( \text{t̄nujji} \text{be} \); cp. \text{bethe} ‘her house’, Cairene. \text{bethe}.

The five vowels \( \text{a}, \text{n}, \text{a} : , \text{e}, \text{e} \), are all variants of the a-phoneme, members of the family which the Arabs called \text{fat} \text{ha} (p. 34). The differences between them are purely phonetic and not grammatical nor radical, and for this reason they are ignored by the Arabs, and in writing no separate signs for them are provided. Their use in speech is determined by the proximity or non-proximity of certain consonants, viz., the velarizers \( \text{t}, \text{d}, \text{z}, \text{s} \), \( \text{r} \), \( \text{t} \), the three velars \( \text{x}, \text{g}, \text{q} \), and the rolled \( \text{r} \). Since therefore their use is consistent, and accuracy in the employment of them in reading and speech is quite essential, it is desirable, in any serious work on Arabic phonetics and pronunciation, to distinguish them by signs. For the rules governing their use see ch. VII.

Though the Arab grammarians phonetics considered them all the same vowel, the phonetic facts were to this extent recognized, that the consonants which cause this variation, and the vowels thus influenced, were called ‘dignified’, the others being called ‘delicate’. For the Arabic terms see pp. 107, 108.

\(^1\) After certain (the majority of the) consonants.
The Vowels Described

Diphthongs.

When two vowels are so placed and so pronounced that they only form one syllable, they are said to constitute a diphthong.

Arabic contains two principal diphthongs, ai and au, and two subsidiary ones, ni and nu. Properly speaking, these are colloquial sounds, for in classical the glide is carried up to the consonantal position (aj and aw instead of ai and au). The sounds are so written in Arabic and must be so pronounced in classical.

1, 2. \[\text{ai, au}\] The Arabic diphthongs ai, au are somewhat similar to the English diphthongs in high, how (hai, hau). There are, however, certain differences: (1) The first element is Arabic a. (2) The second elements are narrow i and u, whereas in English the second elements are at most lax i and u, and often do not rise above e and o.

3, 4. \[\text{ni, nu}\] These diphthongs—as the vowel o itself—are occasioned by the juxtaposition of certain consonants (Ch. vii). They explain themselves. The former is very similar to the English diphthong in boy. The latter is nearer the German diphthong in Haus than the English one in house.

If classical aj, aw may be, reckoned as diphthongal, the above diphthongs are common in that language. In the colloquials all classical diphthongs are replaced by e: and o:; but diphthongs occur in the colloquial, nevertheless, in other word-functions: e.g. jaițu ‘carrying him’, baijit ‘pass the night’ (reduced from bajjit); mə?aule ‘contract’, dauwar ‘turn’ (reduced from dawwar).

For pronunciation-drill on all the consonants (ch. IV) combined with all the vowels (ch. VI) see the Supplement between pp. 48 and 49.
CHAPTER VII

INFLUENCE OF CONSONANTS ON VOWELS

We have seen (p. 44) that the velarized consonants (ᵗ, ṭ, ṭ, ṡ, ṣ, ṡ), the three velars (x, q, q), the uvular q, and the rolled r, modify the vowels which neighbour them. We must now study this influence in greater detail.

The velarized consonants have the strongest influence, and may therefore be called the ‘strongly-modifying consonants’. The other four may be called the ‘slightly-modifying consonants’. All other consonants may be termed ‘non-modifying’.

The rules hold good for both classical and colloquial Arabic in almost all respects, the exceptions being noted as they occur.

(1) Influence of the modifying consonants on an a-phoneme in the same syllable.

We may first give some examples of the un-modified sound, both long and short:

<table>
<thead>
<tr>
<th>Long</th>
<th>Short</th>
</tr>
</thead>
<tbody>
<tr>
<td>bat (‘he passed the night’)</td>
<td>bätt (‘he decided’)</td>
</tr>
<tr>
<td>ḫaːl (‘state’)</td>
<td>ḫall (‘he loosed’)</td>
</tr>
<tr>
<td>laːm (‘letter l’)</td>
<td>lam (‘not’)</td>
</tr>
<tr>
<td>saːʔ (‘it vexed’)</td>
<td>daʔb (‘habit’)</td>
</tr>
<tr>
<td>ʕaːm¹ (‘year’)</td>
<td>ʕan¹ (‘about’)</td>
</tr>
<tr>
<td>baːd (‘he was destroyed’)</td>
<td>bad (‘beginning’)</td>
</tr>
</tbody>
</table>

The following are the rules governing the use of the subsidiary values of the Arabic a-phoneme.

Rule 1. All the modifying consonants, when followed by the a-phoneme, give it the value ʔ. Examples:

<table>
<thead>
<tr>
<th>Long</th>
<th>Short</th>
</tr>
</thead>
<tbody>
<tr>
<td>þʔːl (‘it was long’)</td>
<td>þull (‘dew’)</td>
</tr>
<tr>
<td>ḡʔːf (‘he was guest’)</td>
<td>ḡunn (‘grudge’)</td>
</tr>
</tbody>
</table>

¹ See p. 48 (§ 2).
### Influence of Consonants on Vowels

**Long**  
<table>
<thead>
<tr>
<th>Consonant</th>
<th>Vowel</th>
<th>Consonant</th>
<th>Vowel</th>
</tr>
</thead>
<tbody>
<tr>
<td>ʕm:f</td>
<td>ʕm:n</td>
<td>ʕm:n</td>
<td>ʕm:n</td>
</tr>
<tr>
<td>or</td>
<td>('he drove')</td>
<td>or</td>
<td>('surmise')</td>
</tr>
<tr>
<td>ʕm:n</td>
<td>('he preserved')</td>
<td>ʕm:n</td>
<td>('row')</td>
</tr>
<tr>
<td>ʕm:f</td>
<td>('he feared')</td>
<td>ʕm:f</td>
<td>('fear!')</td>
</tr>
<tr>
<td>ʕm:b</td>
<td>('he was absent')</td>
<td>ʕm:mm</td>
<td>('he grieved')</td>
</tr>
<tr>
<td>ʕm:l</td>
<td>('he said')</td>
<td>ʕɔ:l</td>
<td>('was little')</td>
</tr>
<tr>
<td>ʕm:m</td>
<td>('he desired')</td>
<td>ʔɔ:mm</td>
<td>('Lord')</td>
</tr>
<tr>
<td>ʕm:h</td>
<td>(the second syllable of the Divine name)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Rule 2.** The strongly-modifying consonants, when preceded by a short a-vowel, give it the value ptron. Examples:

- ʃpːt (‘shore’)
- ʃɔːl (‘excellence’)
- ʃɔːl (‘division’)
- ʃɔːl (‘versification’)
- ʔɔːl (the first syllable of the Divine name)

**Rule 3.** The strongly-modifying consonants, when preceded by a long a-vowel, give it the value ɑː; r also usually has the same effect (but see p. 41, note). Examples:

- ɔːʃ (‘it hung’)
- ɔːʃ (‘blazing’)
- ʃɔːl (‘it overflowed’)
- ʃɔːl (‘turn away’).

In Koranic and high-classical reading ɑː is represented by a *glide* from the unmodified a position to the velarized ɔ position, e.g. 橐f, &c., in the above examples. The vowel ɑː doubtless represents the stabilizing of this diphthong, midway; just as eː and oː represent the midway stabilizing of ai, au.

---

1 In full, ʔɔːl ʔɔːl: ʔ.Allah’, ‘God’. 

---
Influence of Consonants on Vowels

Rule 4. The slightly-modifying consonants, when preceded by a short a-vowel, give it the value a(ā), as in English bud. Examples:

ṣaqq (‘splitting’)
ṣard (‘individual’)
ṣaxr (‘vaunt’)
ṣagl (‘mule’).

(2) Additional observations for Egyptian Colloquial.

(i) In Egyptian colloquial ʕ appears to modify both a preceding and a following a-vowel to ā. Thus: ʕali ‘Ali’, ʕan ‘about’, maʕ ‘with’, sound rather like ʕali, ʕan, maʕ. The sound aimed at is, however, the normal Arabic a; the impression of ā is caused by the α-quality inherent in the consonant ʕ.

(ii) In syllables which in classical contained a q and are now pronounced in colloquial with ? or ʔ the a-vowel is unmodified. Examples:

<table>
<thead>
<tr>
<th>Classical</th>
<th>Cairene</th>
<th>Upper Egypt</th>
</tr>
</thead>
<tbody>
<tr>
<td>qplb (‘heart’)</td>
<td>?alb</td>
<td>galb</td>
</tr>
</tbody>
</table>

(iii) In Egyptian colloquial, r, x, q lose something of their modifying power. This is especially the case if the succeeding syllable contains i accompanied by non-modifying consonants. Examples:

<table>
<thead>
<tr>
<th>Classical</th>
<th>Colloquial</th>
</tr>
</thead>
<tbody>
<tr>
<td>rpd:kib (‘riding’)</td>
<td>ra:kib</td>
</tr>
<tr>
<td>xpd:dim (‘servant’)</td>
<td>xa:dim</td>
</tr>
<tr>
<td>qpd:lib (‘prevailing’)</td>
<td>qa:lib.</td>
</tr>
</tbody>
</table>

But usage in this matter is by no means fixed.

(3) Influence of the modifying consonants on an i-phoneme in the same syllable.

When a long or short i succeeds one of the strongly-modifying consonants, a glide of the u, or rather w, type
Influence of Consonants on Vowels

is audible (see p. 40). Thus ti:b ('goodness') sounds rather like ti:b, and so on. Examples:

<table>
<thead>
<tr>
<th>Long</th>
<th>Short</th>
</tr>
</thead>
<tbody>
<tr>
<td>ti:b ('goodness')</td>
<td>tIBb ('medical art')</td>
</tr>
<tr>
<td>?u:kif ('it was added')</td>
<td>qidd ('against')</td>
</tr>
<tr>
<td>qi:l ('it was said')</td>
<td>qilt ('I was said')</td>
</tr>
</tbody>
</table>

(3) Influence of the modifying consonants on an e-phoneme in the same syllable.

The e-vowel of Egyptian colloquial is similarly affected, but to a less degree. Some also think that after a strongly-modifying consonant a variety of e is used which is opener than the normal Arabic e. Compare:

| gesef ('summer')                          | se:f ('sword')                             |
| gesefe ('our summer')                     | sefe ('our sword')                         |
| dæːf ('guest')                            | deːl ('tail')                              |
| dæfe ('her guest')                        | delhe ('her tail')                         |

(4) Influence of the modifying consonants on back vowels.

The modifying consonants do not affect materially the Arabic back vowels. It is therefore proportionately more difficult to bring out the difference between the pairs of consonants themselves. Thus it is difficult to make the difference between the syllables tu and tu. Examples for practice, with the vowel u:

| t语气 ('length')                         | tuːl ('silk')                             |
| dæːrub ('kinds')                        | duruːb ('routes')                         |
| sæːr ('Tyre')                           | suːr ('city walls')                       |
| zæːhur ('appearing')                    | zuhur ('flows')                           |

Examples for practice, with the o-vowel of Egyptian colloquial:

| tɔːb ('brick')                          | tɔːb ('garment')                          |
| tɔbhe ('her brick')                     | tɔbhe ('her garment')                     |
| sɔːt ('voice')                          | sɔːt ('lash')                             |
| sɔtne ('our voice')                     | sɔtne ('our lash')                        |

1 That is, a little nearer the ɛ position.
(5) Influence of the modifying consonants on diphthongs.

As the first element of the Arabic diphthongs is an a-vowel, the diphthongs undergo modifications similar to those described above under (1). Compare the following examples from the classical language:

<table>
<thead>
<tr>
<th>Arabic</th>
<th>English</th>
</tr>
</thead>
<tbody>
<tr>
<td>سَبْيَر</td>
<td>‘becoming’</td>
</tr>
<tr>
<td>قَسْلِ</td>
<td>‘siesta’</td>
</tr>
<tr>
<td>رَمْيَث</td>
<td>‘delay’</td>
</tr>
<tr>
<td>غَدُر</td>
<td>‘other’</td>
</tr>
<tr>
<td>تَوانْق</td>
<td>‘power’</td>
</tr>
<tr>
<td>دَأَوَر</td>
<td>‘starvation’</td>
</tr>
<tr>
<td>قَوْم</td>
<td>‘people’</td>
</tr>
<tr>
<td>سَمْوَى</td>
<td>‘shape’</td>
</tr>
<tr>
<td>رَوْدُغ</td>
<td>‘meadow’</td>
</tr>
<tr>
<td>شَوَف</td>
<td>‘fear’</td>
</tr>
<tr>
<td>قَدوْث</td>
<td>‘succour’</td>
</tr>
<tr>
<td>قَسْنِي</td>
<td>‘my giving’</td>
</tr>
<tr>
<td>قَسْنِي</td>
<td>‘my stick’</td>
</tr>
<tr>
<td>سَرْنِي</td>
<td>‘my buying’</td>
</tr>
<tr>
<td>سَأْرِ</td>
<td>‘march’</td>
</tr>
<tr>
<td>كَأْل</td>
<td>‘measure’</td>
</tr>
<tr>
<td>سْأْرِ</td>
<td>‘sheikh’</td>
</tr>
<tr>
<td>مَأْل</td>
<td>‘inclination’</td>
</tr>
<tr>
<td>تَأْنِق</td>
<td>‘longing’</td>
</tr>
<tr>
<td>دَأْر</td>
<td>‘age’</td>
</tr>
<tr>
<td>كَأْم</td>
<td>‘heap’</td>
</tr>
<tr>
<td>سَأْوِغ</td>
<td>‘slope’</td>
</tr>
</tbody>
</table>

(6) Influence of modifying consonants on the vowels of syllables other than those to which they belong.

The influence of the modifying consonants is not confined to the vowel of the syllable in which the consonant occurs. In particular the velarizing consonants (ت، ث، س، ض، ط) exert considerable influence on more remote vowels as well.

Thus they influence an a-vowel of the preceding syllable, giving it the value ء. Examples:

<table>
<thead>
<tr>
<th>Arabic</th>
<th>English</th>
</tr>
</thead>
<tbody>
<tr>
<td>فَلْسُمَا</td>
<td>‘eloquence’</td>
</tr>
<tr>
<td>برْسِر</td>
<td>‘sighted’</td>
</tr>
<tr>
<td>فَتِن</td>
<td>‘wise’</td>
</tr>
<tr>
<td>فَدْيَلَا</td>
<td>‘virtue’</td>
</tr>
<tr>
<td>ضْمِإْم</td>
<td>‘great’</td>
</tr>
</tbody>
</table>
Influence of Consonants on Vowels

This occurs even when a non-modifying consonant-phoneme intervenes. Examples:

\[
\begin{align*}
\text{m\text{-}ntiq} & \quad (\text{‘logic’}) \\
\text{m\text{-}nt\text{i}} & \quad (\text{‘signed’}) \\
\text{m\text{-}ns\text{-}r} & \quad (\text{‘victorious’}) \\
\text{m\text{-}n\text{sr}} & \quad (\text{‘appearance’}) \\
\text{m\text{-}sr\text{-}r} & \quad (\text{‘ruled’} \; (s > s)).
\end{align*}
\]

The strongly-modifying consonants are able to affect vowels even farther away than this. Thus the words which were originally pronounced \text{bas\text{-}t}, \text{basa\text{-}t}, are in modern pronunciation \text{b\text{-}st} (‘he spread’), \text{b\text{-}st\text{-}t} (‘simplicity’). In words like \text{\text{\text{-}n\text{-}st\text{-}t} (‘knots’) even the a-vowel of the first syllable is given a very slight inclination towards a.

The slightly-modifying consonants influence the a-vowel of a preceding open syllable, giving it the value a \(= \text{\a} \). Examples:

\[
\begin{align*}
\text{f\text{-}nd} & \quad (\text{‘he lost’}) \\
\text{f\text{-}xm} & \quad (\text{‘magnificent’}) \\
\text{\text{-}\text{-}b} & \quad (\text{‘tumult’}) \\
\text{b\text{-}rd} & \quad (\text{‘he filed’}) \\
\text{b\text{-}rd} & \quad (\text{‘he was cold’}).
\end{align*}
\]

But r loses this power if the vowel following it is i. Examples:

\[
\begin{align*}
\text{b\text{-}\text{-}rd} & \quad (\text{‘cold’}) \\
\text{b\text{-}\text{-}d} & \quad (\text{‘mail’}) \\
\text{b\text{-}r\text{-}k} & \quad (\text{‘bless!’}), \text{contrast \text{t}\text{-}\text{-}\text{-}k} (\text{‘he is blessed’}).
\end{align*}
\]

It should be noted that some teachers minimize the modifying influence of r.
CHAPTER VIII

INFLUENCE OF CONSONANTS ON EACH OTHER

Consonantal changes may be conveniently discussed under the following main heads:

A. Partial assimilation: the unvoicing of voiced consonants.
B. Other cases of partial assimilation.
C. Complete assimilation.

A. The unvoicing of voiced consonants.

Most English speakers are unaware that initial and final voiced plosives and fricatives (b, d, g, v, z, &c.) are, in ordinary English pronunciation, partially unvoiced (and with some speakers completely so). What happens is that the vocal chords are not kept in vibration during the whole of the articulation of the consonant. Thus the English pronunciation of the words zinc, go, fig, give, might be indicated roughly, thus: £zɪŋk, kɡou, ɡɪɡk, kɡɪvɛ; rather than by the less accurate zɪŋk, gɔu, ɡɪɡ, gɪv. When one of the above-mentioned consonants is final and preceded by a consonant, complete unvoicing is particularly frequent. Thus sound, sounds, are generally pronounced saʊnd, saʊndz. (This ɹ is the sign of unvoicing.)

N.B.—Unvoiced ŋ, ð, ʒ, &c., are not identical with p, t, s, &c., for p, t, s, &c., are pronounced with greater pressure and greater force of breath than ŋ, ð, ʒ, &c. In the Latin nomenclature, p, t, s, &c., are known as ‘tenues’, ŋ, ð, ʒ, &c., as ‘mediae’.

In Arabic, both classical and colloquial, such unvoicing of initial voiced consonants does not take place. It is not so easy for the English learner to keep initial voiced consonants fully voiced. He will often find himself (to his annoyance) pulled up by his sheikh for pronouncing a word like balaḥ (‘dates’) as palaḥ. The Englishman feels confident that he
is saying balaḥ, but the Egyptian hears the initial English \( b \) as a \( p \).

The old Arabs took great pains to avoid unvoicing voiced plosives, whether final or preceding another consonant; they went so far as to insert a very short vowel (no doubt an \( a ^{\prime} \)) in order to make unvoicing of the plosives impossible. Thus they would say hab\( ^{\prime} \) (‘concede’), kalb\( ^{\prime} \) (‘dog’), baḍḍ\( ^{\prime} \) (‘after’), ib\( ^{\prime} \)daːl (‘substitution’), id\( ^{\prime} \)n\( ^{\prime} \)l (‘introduction’), iḍt\( ^{\prime} \)haːd (‘diligence’).\(^1\)

In the modern pronunciation of classical it is not necessary to insert these vowels. But in order to produce the best effect in public speaking, it is certainly advisable to take pains to voice all the voiced consonants fully.

In colloquial the partial or complete devoicing of voiced consonants is common when they are final, and particularly when they are preceded by another consonant. Thus:

\[
\begin{align*}
\text{faːd} ('he informed') & \text{ is often pronounced faːd} \\
\text{baːb} ('door') & \text{, , , baːb} \\
\text{raːq} ('it sold well') & \text{, , , raːq} \\
\text{nəs\( ^{\prime} \)b} ('cheating') & \text{, , , nəs\( ^{\prime} \)b} \\
\text{waːz} ('sermon') & \text{, , , waːz} \\
\text{baːz} ('hawk') & \text{, , , baːz} \\
\text{ḥaq\( ^{\prime} \)z} ('distraint') & \text{, , , ḥaq\( ^{\prime} \)z} \\
\text{ʔn\( ^{\prime} \)d} ('purpose') & \text{, , , ʔn\( ^{\prime} \)d}.
\end{align*}
\]

Unvoicing also takes place in colloquial Arabic as the result of regressive assimilation. Examples:

\[
\begin{align*}
\text{sabt} \text{ (for sabt) ('Sabbath')} \\
\text{ḥḌf\( ^{\prime} \)d}(\text{ (for ḥḌf\( ^{\prime} \)d)} ('I kept') \\
\text{biritt} \text{ (for biridt) ('I got cold')}
\text{ xatt} \text{ (for xadt) ('I took')}
\text{ʔn\( ^{\prime} \)d\( ^{\prime} \)t} \text{ (for ʔn\( ^{\prime} \)d\( ^{\prime} \)t) ('I was paid').}\(^2\)
\end{align*}
\]

\(^1\) The consonants after which they inserted this vowel were b, d, t, j, q, which were called (muqḍlq\( ^{\prime} \)la) (‘the sounds provided with a quick vowel’). It is not clear why t and q were included among these consonants. That would seem to indicate that originally these two consonants were voiced (\( = \dot{a} \) and q); and it is a fact that the Arabs classified them with the muğhar\( ^{\prime} \) or ‘voiced’ consonants. Nevertheless the idea is a surprising one. See p. 99.

\(^2\) Recognized in classical.
Influence of Consonants on each other

A number of consonants unrecognized in the Arabic alphabet occur as the result of (colloquial) unvoicing. Examples:

\( \text{m} \) as in \( \text{qism} \) \(^1\) ('division')
\( \text{n} \) ,, \( \text{matn} \) \(^1\) ('text')
\( \text{l} \) ,, \( \text{flg} \) \(^1\) ('radish')
\( \text{t} \) ,, \( \text{rpt} \) \(^2\) ('pound')
\( \text{s} \) ,, \( \text{sitr} \) \(^1\) ('curtain')
\( \text{j} \) ,, \( \text{qum} \) \(^2\) ('blind man')
\( \text{b} \) ,, \( \text{zamb} \) ('sin') (for \( \text{zamb} \)).

The \( \text{w} \) of such words as \( \text{nahw} \) ('syntax'), \( \text{qafw} \) ('pardon'), is more usually heard either as the vowel \( \text{u} \) or as a softly whispered \( \text{u} \).\(^3\)

When in the course of word formation \( \text{q} \) comes to be immediately followed by \( \text{t} \) or by \( \text{h} \) (both of them voiceless consonants), a kind of assimilation takes place by which the \( \text{q} \) is changed into \( \text{h} \). We have seen that \( \text{q} \) is not merely a voiced \( \text{h} \) (pp. 27–9), yet it is convenient to notice this case of unvoicing under the present head. Examples (colloquial):

\( \text{bithhe} \) ('sell it') (for \( \text{biqhe} \geq \text{bithhe} \geq \text{bithhe} \))
\( \text{bitahitu} \) ('belonging to him') (for \( \text{bitathitu} \)).

B. Other cases of partial assimilation.

Other instances of partial assimilation (colloquial except when otherwise noted) may be conveniently considered under the following heads:

(a) The assimilation of non-velarized consonants to velarized consonants.

(b) The assimilation of voiceless sounds to voiced sounds.

(c) Other partial assimilations.

\(^1\) These words are also sometimes pronounced \( \text{qism}, \text{matn}, \text{flg}, \text{rpt}, \text{sitr} \), with voiced syllabic \( \text{m}, \text{n}, \text{r}, \&c. \) This pronunciation prevails in Syria, where many speakers also insert a weak or even a strong e-phoneme vowel before the consonants.

\(^2\) \( \text{j} \) is the 'media' corresponding to the German 'tenuis' \( \text{q} \) (the ich-consonant).

\(^3\) The weak character of this \( \text{w} \) was recognized by the old Arabs, who called it \( \text{bismm}, \) i.e. 'giving the flavour of' \( \text{w} \).
Influence of Consonants on each other

(a) The following are examples of the assimilation of non-velarized to velarized consonants:

1 > t. E.g. twórb ('request') (for творб),
   ʔutarb ('ask !') (for ʔutarb).

t > t. E.g. ʔatتb: (‘being disturbed’) (for ʔاتتb:
   ʔistilah (‘reconciliation’) (for ʔистилah)
   muttalib (‘demanding’) (for muttalib)
   talatʕafar (‘thirteen’) (for talatʕafar).

s > s. E.g. ąsisi:t (‘simple’) (for basi:t)
   mabsut (‘content’) (for mabsu:t)
   ʔimbisn:t (‘contentment’) (for ʔinbisa:t).

d > ʕ. E.g. ʔaftar (‘account-book’) (for daftar)
   ʔiḥdaʃar (‘eleven’) (for ʔiḥdaʃar).

A few cases of deveralizing occur, for no very apparent
reason, e.g.
   mishaq (‘annoyed’) (for mitqaq)
   dajiqni (‘he annoyed me’) (for ʔaʔiqni)
   sadda (‘he believed’) (for ʔandaq).

These forms are all colloquial, except where otherwise noted.

(b) The following are examples of the assimilation of voiceless sounds to voiced sounds.

   t > d, after z. E.g. ʔizdija:d (‘increase’) (for ʔiztija:d)
   f > v, before z. E.g. ʔizv (‘keeping’) (for ʔifz)
   s > z, before d. E.g. mazdu:d (‘blocked’) (an occasional
   colloquial form for masdu:d)
   s > ʕ, before d. E.g. maʔdar (‘infinitive’) (for maʔdar).

1 Recognized in classical, where the assimilation, moreover, is
   represented in the character.
2 This assimilation is recognized by the grammarians and is shown
   in Arabic character.
3 We see here a further instance of the spontaneous production of
   the consonant v, which is unrecognized in the alphabet: though the
   old Arab phoneticians noted the sound (in this position) as a pro-
   vincialism.
4 This assimilation also was noted and recognized by the old Arab
   phoneticians, though only as a provincialism.
(c) The following are examples of some miscellaneous partial assimilations:

\[ n > m \] in *qamb* ‘side’ (for *qanb*), *ʔimbisːt* ‘contentment’ (for *ʔimbisːt*).

Before \( f \), \( n > \) the labio-dental nasal \( m \), e.g. *sānff* ‘sort’ (for *sānf*). This consonant and the following may be added to the list of consonants unrecognized by the Arabs themselves.

\( n > η \) (the velar nasal, English *ng*): this naturally but not invariably results from the juxtaposition of \( n \) and \( k \) or \( q \). Exx.: *bānk* ‘office’ for *bank*, *bīng* ‘chloroform’ for *bing*.

\( n > ŋ \). This consonant is recognizable in Koranic chanting. It occurs where an ending in \(-n\) is succeeded by initial \( j \). It is a sound similar to French and Italian *gn*, Spanish *ū*. Exx.: *bājtūn juskān* ‘a house that is inhabited’, for *bajtun*. The nasalizing of the previous vowel,\(^1\) which always accompanies this particular combination, is called ‘the \( n \) of singing’ (*nuːnu l ǧunna*).

C. Complete assimilation.

The best known and commonest instance of complete assimilation is that of the \( l \) of the definite article, which becomes \( t \) before initial \( t \), \( s \) before initial \( s \), &c. (see p. 79).\(^2\)

To these the colloquial adds occasionally \( q \), as in *ʔiq ġabal* (‘the mountain’) (for *ʔil ġabal*), and, very seldom, \( k \), as in *ʔik kūrsī* (‘the chair’) (for *ʔil kūrsī*).

Other examples of complete assimilation in Egyptian colloquial are the following:

\( t \) is assimilated to the succeeding consonant in certain verb combinations; e.g. *ʔiqqāwźiz* (‘he got married’) (for *ʔitqāwźiz*), *jīsˤāwwarz* (‘he imagines’) (for *jitˤāwwarz*).

\( ? \). In all Arabic dialects, even including the classical, \( ? \) has shown a tendency to pass into : (length) after a, into w after u, and into j after i. Moreover, it frequently suffers elision (see p. 79).\(^3\)

\(^1\) Denoted by the sign ‘\( \sim \)’.

\(^2\) The consonants *ن, ل, ظ, ط, ض, ص, ض, س, ز, ر, د, ث, ت*, to which this applies are called in Arabic *jama’ija* (‘solar’) consonants.

\(^3\) Even the old Arab purists noticed how the reduction of *ʔ* to
n > t in kutt ('I was') (for kunt)—colloquial.

n > r in mir ṭḥmatik ('of thy mercy') (for min ṭḥmatik), mir ṛigle:h ('from his feet') (for min ṛigle:h)—classical.

l > n when the preposition 'to' is in juxtaposition with n, as in ḫulinnā ('say to us') (for quli lna)—colloquial.

f > $ in nuṣṣ ('half') (for nuṣf)—colloquial.

ʃ (the colloquial negative) is assimilated to final s, z, s, ə,

e.g. ma niḥbasʃ 'we do not imprison' becomes ma niḥbaʃʃ, and so

ma niḥbasʃ ('we do not bake') > ma nixb{iʃ
ma niḥbaʃj ('we do not keep') > ma nixb{iʃ
ma ju?ruʃ ('it does not sting') > maju?ruʃ.

On the other hand, the opposite process may take place, and so one hears ma niḥbasstalk, &c., where the ʃ is attracted retrogressively to the preceding consonant. Sometimes, too, a faint 'flavour' of the ʃ is heard; e.g. ma nix'bizʃ.

vanishing point in a word like ruṣṣa: ('chiefs') or suṣa: ('question') created an effect to which they gave the non-committal name of hamzatu bāj bājn ('the hamza of betwixt and between'), meaning presumably that the above words were pronounced between ruṣṣa: and ruwassa:, suṣa: and suwa:al. Possibly the actual pronunciation was ruṣa:, suṣa:al. If this inference is correct, we have here the solitary instance of a phenomenon supposed to be impossible in Arabic, viz. consecutive vowels.

1 We would thus seem to have, in such circumstances, a velarized ʃ. The ʃ is attracted to ʃ, but imposes on consonant and vowel its velarizing secondary articulation.

2 Ar. ismām.
CHAPTER IX

EXERCISES IN DIFFICULT WORDS

The object of this chapter is to collect and classify words containing groups of consonants and vowels that are likely to present features strange or difficult to the student. The examples selected are from the classical.

A. Words with double consonants.

When in the natural flow of an English sentence there come together two words which respectively end and begin with the same consonant, we do not finish the first completely off, separating it from the second, but we run the two together so as to form one long consonant with, in some cases, a diminution of intensity in the middle. Examples: the squib burst, bad dog, if feasible. The same thing may be observed in compounds such as midday, pen-knife, wholly.

In Arabic this same phenomenon occurs continually in the middle of ordinary words. The difference between double consonants and single consonants is, however, greater than in English. Consequently, English-speaking people are apt sometimes to make the doubled consonants not long enough, and sometimes to make a single consonant too long.

Such mistakes are particularly frequent when the preceding vowel is short and stressed; thus the English speaker is tempted to lengthen the ِل of ِنَكَلَمَا ََ word as part of his stressing or accenting of the first syllable. Yet it will be the same speaker who fails to bring out the doubled ِل in ِنَكَلَمَا. Such is human perversity!

To avoid the mistake of shortening doubled consonants the following directions should be observed.

For the plosive consonants, start with a word containing doubled ِب, e.g. ِنَبَبَبَد (‘eternalize’). Pronounce the syllable ِبَبَب, but when the ِب-position has been reached, hold the lips steadily together without exploding the ِب. Then

1 This doubling is called in Arabic ِدِدَبْبِم (‘contraction’) or ِتُسْدِم (‘reinforcement’). The sign written over the consonant-letter in Arabic writing is called ِسِد (‘force’).

2 The sign for accent (i.e. tone) is placed immediately in front of the accented syllable.
pronounce the second syllable, starting the second b without changing from the position arrived at for the first b. Then practise similar exercises with the other plosive consonants.

For the other consonants, e.g. the ś in 'bassard ('evangelize'), continue the sound twice as long as usual, making a new breath-impulse half-way through the sound.

To cure the mistake of making single consonants too long, especially after an accented syllable, is not always an easy matter. The correct pronunciation is best arrived at by considering the consonant to belong to the vowel following, and to have nothing to do with the vowel preceding. Thus in 'kalima the l must be imagined to belong exclusively to the i and to have nothing to do with the preceding a, thus ka-li-ma, not kal-im-a. The difficulty lies in the fact that in English short vowels (with the exception of i and o) are invariably connected to a following consonant. It is, therefore, a useful exercise for students to practise isolating the English short vowels, e.g. practising the syllables cat, dog, bed, put, cup, without their final consonants.

Another case to which English people should give special attention is the case of words in which the vowel immediately following the double consonant is accented, e.g. kal'lamtuha: ('I spoke to her').

Double consonants may occur at the ends of words, as in sitt ('lady'). Indeed, in the colloquial a single terminal consonant preceded by a short vowel is rarely found. Special care must be taken to distinguish between long and short consonants occurring at the end of a sentence. It should be noted that the English t in such a word as sit is intermediate in length between an Arabic single t and an Arabic double t.

The first part of a doubled consonant may be considered to belong to the preceding syllable, while the second part belongs to the syllable following. It is important to remember this in connexion with the effect of consonants on preceding and following vowels. Thus in sōttu: ('they sinned') the vowels are as in sōt and tu; and in bāxxu: ('they snored') the vowels are as in bāx and xu.

1 More difficult is the Egyptian colloquial kallim'taha ('I spoke to her').
Examples of single and double consonants.

1. b. ?abad (‘eternity’)\n   \n2. t. batal (‘virgin’)\n   \n3. d. hadama (‘pull down’)\n   \n4. t. bṭṭol (‘hero’)\n   \n5. ḍ. ḥādāma (‘digest’)\n   \n6. k. fakar (‘think’)\n   \n7. q. ḥagār (‘stone’)\n   \n8. q. faqr (‘be poor’)\n   \n9. ṭ. saʔalahu (‘he asked him’)\n   \n10. m. kamal (‘perfection’)\n    \n11. n. hana (‘cheerfulness’)\n    \n12. ḫ. fajal (‘paralysis’)\n    \n13. r. barad (‘file’)\n    \n14. ū. ḥaʔar (‘trace’)\n    \n15. ḍ. ḥadār (‘caution’)\n    \n16. s. fasal (‘wean’)\n    \n17. z. nazar (‘vow’)\n    \n18. s. ḡuṣala (‘be divided’)\n    \n19. ẓ. ṣawār (‘eyesight’)\n    \n20. j. fajsal (‘weakness’)\n    \n21. x. fakhīm (‘magnificence’)\n    \n22. g. ḡuṣf (‘press’)\n    \n23. ḥ. qϕhār (‘be victorious’)\n    \n24. ḫ. ṣawāb (‘free space’)\n    \n25. ū. laʔab (‘play’)\n    \n26. j. ḥajj (‘shame’)\n    \n27. w. ḥawwā (‘air’)
    
B. Other specially selected words (classical).

CHAPTER X

CONTINUOUS SPEECH

We have hitherto been considering the pronunciation of isolated Arabic words, for the purpose of analysing their sound-elements and of giving practice in those elements. But detached words do not make speech any more than vocabularies make literature. Words only occur in speech as elements of connected sentences. Contrary to common belief, there is no more pause between words in continuous speech (that is, between two breath-pauses) than there is between the syllables of a single word. The spaces between words in writing and printing are used to aid the eye, but they have nothing corresponding to them in phonetic fact.

Moreover, as we shall see, words occurring in connected speech often modify each other in important ways.

It will be convenient to discuss the subject of this chapter under two main aspects, namely:

Accent and Length.

Human speech secures variety and avoids monotony by varying the values of different syllables in different ways. Arabic shares two of such ways with English: namely, accent or tone, and length or quantity.

Accent or tone, as the names imply, is an altered musical pitch, which regularly accompanies the vowels of certain syllables. Length, or quantity, is simply the prolongation of certain vowel-sounds by the voice.

The symbol for accent is ′, placed immediately before the syllable the vowel of which is 'accented', that is, has its musical pitch raised several notes higher than the surrounding vowels.\(^1\) The symbol for increased length is ‼, and that for half-length ′.

It may be remarked here that stress, which is a term often used loosely for high pitch, denotes an entirely different thing,

\(^1\) The sign ′ is commonly used to denote stress (see below). In this book it exclusively denotes intonation.
Continuous Speech 67

viz., an increase of breath-volume (due to increased lung-pressure) with which certain syllables are stressed. Emotional stresses are found in Arabic as in all languages: but these are occasional and irregular and therefore outside our present subject. When they occur, they are accompanied by accent, the tone of which may in such cases be lowered as well as raised.¹

We must now discuss Accent and Length, (A) in a typical Arabic Colloquial, and (B) in Classical Arabic. The word-changes due to accent and length in Arabic obey laws which are very differently applied in classical and colloquial Arabic, though there is a complete unity of principle about the laws themselves. As the system has been most elaborated in colloquial (Egyptian) Arabic² it will be convenient to take it first. A firm grasp of these laws and their application, affecting as they do the quantity as well as the tone-accent of syllables, is absolutely essential to the acquisition of good colloquial.

(A.)

Quantity in Egyptian Colloquial.

Three degrees of vowel length may be observed in ordinary talk. These may be termed long, short, and very short. Taking the short vowel as our unit, we may consider the long vowel as about twice its length, and the very short one to be half its length. Full length is indicated by ;, and extra shortness by small letters placed above the line.

Examples of short and long vowels are seen in the word wilaːd (‘children’).

The very short vowel is found at the beginning of words in unstressed position. It is sometimes so short that it is

¹ e.g. the deprecating ‘I don’t think so’ in English.

² In this connexion it is worth noting that this system strongly resembles the system of Hebrew ‘accentuation.’ Much of what to said in this chapter applies to Syrian and other colloquials. The distinctive peculiarities of accentuation, etc., in these colloquials, however, cannot be followed out here.

In all that is said in this chapter, the philological question of the priority of colloquial or of classical, and their relation generally, is left entirely aside.
almost impossible to determine its quality. Example: m`daːris (‘schools’).1

Effect of words on each other.

We now proceed to explain the principles relating to the effect of words on each other in connected speech.

(1) It is a fundamental principle in Arabic, both classical and colloquial, that a long vowel may not stand before a non-final closed syllable.2 In accordance with this rule, words the vowel of which was originally long, have that vowel shortened when a closed consonant follows. It makes no difference whether the following consonant belongs to the word itself or to the next word. The following examples show the way colloquial Arabic applies this principle:

kitaːb ‘a book’ but kitab kibːiːr ‘a big book’ (aː shortened before b and k)

?eːh ‘what?’ , ?eh da ‘what is that?’ (eː shortened before h and d)
baːb ‘door’, babːa ‘her door’ (aː shortened before b and h).

(2) Colloquial aims at the reduction of short vowels occurring in succession. When the second of such a series is unaccented it is elided, provided that it is i, u or ø, but not a.

Exx.:

daˌktaːb for da kitaːb ‘this is a book’
jaˌmḥammad for ja mḥammad ‘O Mohammed’
maˌlkuːʃ for ma lkuːʃ ‘you have not’
jagaliti for jagaliti ‘my bicycle’

But if such a syllable is accented no elision takes place, e.g. :
huːwaˈnisːi not huːwaˌnsi ‘he forgot’
huːwaˈxuluːʃ not huːwaˌxluːʃ ‘it was finished’.3

The a-vowel resists this tendency uniformly. Contrast huːwa kariːm ‘he is noble’ with huːwaˌkbiːr (for kibiːr)

1 Syrian m`darris: and similarly throughout, e.g. k`tab ‘book’.
2 Except at the end of a clause: and, in classical, before doubled consonants, e.g. ḫassā ‘feeling’.
3 An exception may occasionally be noted, e.g. li ḫaddiˌhna ‘to this point’, for ḫina, though ḫi is accented.
‘he is old’; and ana ḥurubtu ‘I struck him’ with ana msiktu (for misiktu) ‘I seized him’. And similarly the u-vowel.

This phenomenon is exactly parallel to the elision of ‘e muet’ in French (e.g. in je ne peux pas, le chemin de fer, where je_n peux pas, le_ch min_d fer are what is actually said).

(3) A consonant must either be followed or preceded by a vowel (except at the end of a sentence). A group of three successive consonants is impossible in Arabic. When, therefore, a word ending in two consonants is followed by a word beginning with a consonant a very short vowel is inserted at the end of the first word. Thus ğumtɪ fɪs subh ‘I rose in the morning’, to prevent the group mtf; il ḥibrɪ ṯojjib, ‘the ink is good’, to prevent the group bṛt; is sitti nur ‘Mrs. Nur’, to prevent ttn. The ordinary foreigner’s solution of the difficulty ğumt fɪs subh, il ḥibr ṯojjib, is sit nur: is quite incorrect. A vowel must be added, not a consonant dropped or weakened.¹

This very short intrusive vowel becomes an ordinary short vowel when it receives accent, e.g. ğul’ti lu ‘I said to him’, but ğultɪ lir raqīl ‘I said to the man’. For this reason when the euphonic vowel occurs in the word itself owing to the suffixing of a preposition, it is of ordinary length, e.g. ib’nina ‘our son’.

The intrusive vowel is i, except before pronouns in a or u: e.g. ib’naha ‘her son’, ib’nuhum, ib’nukum ‘their, your son’.

(4) The intrusive vowel may even occasion the elision of a short vowel in the next word, in the way described under Rule (2). In this case also it receives accent and becomes an ordinary short vowel. Examples:

ḍul’ti лха ‘I said to her’, for ġultɪ laha
katab’ti bha ‘I wrote with it’, for katabtɪ biha
ṣuf’ti mḥammad ‘I saw Mohammed’, for ġuftɪ mḥammad
far’ṯi kbi:r ‘a great difference’, for farṯi kbi:r.

¹ It will be seen that this principle is similar to that found in French (Parisian pronunciation); e.g. in peuple (pronounced when by itself as a monosyllable) the final e (e) is sounded when succeeded for example, by français. Similarly montre-moi, autrefois.
(5) If the elision of a short vowel after the manner noted in Rule (2), causes a long vowel to be followed by two consonants, that vowel is shortened either partially or entirely, as described in Rule (1). In this way two abbreviations, for the sake of speed and facility, are made in a single word. For example kaːti'baːha ‘writing (f.) it’ becomes in colloquial kaːt'baːha (not kaːt'baːha), and taːsiːa ‘the ninth’ (f.) becomes taːaṣaːa.

This process of shortening may involve change in the value of an a-vowel (see pp. 46–48). Compare ḫaːtit ‘placing’ with ḫaːttu (contracted from ḫaːtitu) ‘placing it’.

If the elided vowel is preceded by j or w, the j or w tends in colloquial to become reduced to i or u, forming a diphthong with the preceding vowel. Compare:

Jaːjil ‘carrying’ with jaːlīlu ‘carrying it’
Jaːwuz ‘wishing’ with jaːuzu ‘wishing it’.

The process may be carried even further. Thus the classical jaː?ilatī ‘my family’ is pronounced in colloquial ḫeːlit, having no doubt developed through the following stages, jaː?iliti > ḫaː?ilti > Jaːjilīti > ḫaːilīti > ḫeːlit, and so ḫeːlit. Similarly the name Ayesha, jaː?fisā > ḫaːjīsa > jaːisā > ḫeːja.

(6) Long vowels lose their length when the syllable occurs in low-pitched position, even when there is no sequence of consonants necessitating shortening. Examples:

Jaːzeːd ‘O Zaid’ for jaːzed
Jaːbilni ‘he met me’ for Jaːbilni (contrast ‘Jaːbil məhammad ‘he met Mohammed’)
Jaːfu ‘they saw’ for Jaːfu, but Jaːfuːha ‘they saw her’ for Jaːfuːha:
Laʔu ‘they met’ for Laʔu:
Jaʔu ‘we saw’ for Jaʔu.

(7) Initial ? (see p. 80) is omitted in connected speech. When this omission brings two vowels together (i.e. the final vowel of one word and the first vowel of a following word), one of the vowels disappears. If the vowels are dissimilar the second usually prevails over the first, though occasionally
the reverse is the case. If they are similar, it is of course immaterial which we consider to be the one that gives way. Examples:

\texttt{kunt\_a\_fil} ‘I was shutting’ for \texttt{kunt\_i\_a\_fil}
\texttt{ja\_xti} ‘O my sister’ for \texttt{ja\_uxti}
\texttt{hibr\_iswid} (or \texttt{hibri\_swid}) ‘black ink’ for \texttt{hibri\_iswid}
\texttt{j\_abu\_ja} (or \texttt{ja\_bu\_ja}) ‘O my father’ for \texttt{ja\_abu\_ja}.

Two examples of elided ? may occur in successive syllables, with result like the following:

\texttt{l\_iswid} ‘the black’ for \texttt{?il\_iswid}
\texttt{l\_imti\_ha\_n} ‘the examination’ for \texttt{?il\_imti\_ha\_n}.

\textit{Note carefully}: the glottal-stop that replaces classical q (represented by the sign ?) is never elided under any circumstances.

\textit{Accent (intonation) in Egyptian Colloquial.}

Rules which would cover all cases would be too complicated and therefore ineffective. It is better, therefore, to formulate the following general principles:

(1) The high pitch can only fall on the final syllable if that syllable terminates in two consonants, as \texttt{\textasciitilde{d}\textasciitilde{g}\textasciitilde{r}\textasciitilde{b}t} ‘I struck’, or in a long vowel followed by a consonant, as \texttt{ba\textasciitilde{r}d\textasciitilde{a}n} ‘cold’.

(2) Otherwise the penultimate receives accent in almost every case, even when its vowel is unimportant and euphonic, and the preceding syllable is important, e.g. \texttt{\textasciitilde{d}\textasciitilde{g}\textasciitilde{r}\textasciitilde{b}t\textasciitilde{i}ni} ‘you struck me’, though the i is a mere passing vowel, \texttt{mad\textasciitilde{r}\textasciitilde{r}\textasciitilde{\textasciitilde{o}}\textasciitilde{\textasciitilde{s}}e} ‘school’. (In Upper Egypt the anti-penultimate more frequently receives accent, e.g. ‘\texttt{mad\textasciitilde{r}\textasciitilde{r}\textasciitilde{r}\textasciitilde{o}}\textasciitilde{s}e} ‘school’).

(3) The anti-penultimate is accented if the penultimate is short and the final does not fulfil the conditions of (1), e.g. \texttt{\textasciitilde{d}\textasciitilde{g}\textasciitilde{r}\textasciitilde{b}u\_bu} ‘they, she struck’.

1 N.B. (a) Final vowels cannot receive accent. (b) It is not enough even when a short vowel is followed by a consonant in a final syllable. Before it can receive accent either the vowel is lengthened or the consonant is doubled, e.g. \texttt{\textasciitilde{t}um ‘rise!’ becomes \textasciitilde{t}um in colloquial, and \textasciitilde{t}ab ‘father’ becomes \textasciitilde{t}abb.}
Continuous Speech

Shifting of Accent.

Shifting of accent is a most important feature of Arabic pronunciation. This shifting of the high pitch is caused in the following ways:

(1) By the suffixing of enclitic pronouns beginning with consonants (including la/k ‘to you’, etc.); examples: f[a]/fu:ni ‘they saw me’, la/ʔu:kum ‘they met you’, fuf’na:ha ‘we saw her’, ʔa/lu:li ‘they said to me’.

It will be noticed that the shifting of the accent by the enclitic has restored to the preceding syllable in these examples its lost length, and has simultaneously robbed the first syllable of its length through depriving it of accent. It should be observed that enclitics cause the very short intrusive vowels to be of ordinary short length, and give them stress; example: ʕa/ʔilu ‘I said to him’.

(2) By the suffixing of the negative ʃ which throws stress on to the last vowel, thus shortening all preceding vowels; examples:

ma ʃəru:bu:ni:f ‘they did not strike me’, for ma: ʃəru:bu:ni:f

It will be seen that this last expression has undergone no less than five curtailments, two short vowels having been elided, and three long having become short. Of these three, two were shortened through the monopolizing of the stress by the final syllable.

(B.)

Classical.

When we compare colloquial Arabic speech with classical speech, we find just the broad differences of principle which we should expect when the ends and uses of the two dialects are considered. The object of a colloquial is to facilitate the exchange of thought by means of rapid, easy speech; while

1 The term ‘enclitic’ is given to syllables which have the property of accentuating the last syllable of the preceding word. As a consequence they practically become part of that word.
a literary language, which is the vehicle of recitation, of oratory and poetry, of reading literary texts aloud, will be less preoccupied by speed than by stateliness, deliberateness of rhythm and elaboration of syntax.

From these considerations it results that colloquial Arabic, as we have seen, carries contractions to a much farther point than classical; short vowels are constantly elided and long vowels constantly shortened, these contractions being subject only to the restriction that the consonants must not overload the vowels.

The classical language, on the other hand, carries the system of intrusive vowels to a much farther point than the colloquial. This secures the steady, easy, rhythmic march of words, does not sacrifice long syllables, and affords immense opportunity for syntactical elaboration. The characteristic differences of the two languages are well seen by their respective expressions for 'her door', viz.:

colloquial:  babhe (= 3 length-units)
classical:  ba:buha: (= 5 length units).

We call the particular attention of students to this contrast. Many who have studied classical spoil their colloquial by inserting these euphonic vowels instead of shortening the previous long vowel (see above p. 68).

Or again, contrast:

classical:  ḫaːrətəhum 'their street'
colloquial (omitting euphonic u):  ḫaːrithum.

Moreover, these short final vowels are specialized in the classical language, and become the vehicle for declension and conjugation. Thus:

qumtu  fis  subh  'I rose in the morning'
qumta  fis  subh  'You (m.) rose in the morning'
qumti  fis  subh  'You (f.) rose in the morning'

Colloquial, in all three cases, ḥumti  fis  subh.

ba:buha: (nom.) 'her door'
ba:baha: (acc.)  ''
ba:biha: (gen.)  ''

Colloquial, in all three cases, babhe.
Accent in Classical Arabic.

Intonation in classical Arabic, as used orally, follows in general the lines indicated on p. 71, with this principal difference, that the accenting of the ante-penultimate is much commoner than in colloquial. If that syllable is long, by nature or position, it receives accent as well, and the penultimate is left unaccented: e.g. َدَرْبَبْتُهُم (coll. َدَرْبَبْتُهُم).

Accent on the fourth syllable from the end is possible in classical, but not in colloquial: e.g. َلْهَرْبَكُتُهُ ‘movement’; َذَرْبَبْتُاک ‘she struck you’ (coll. َذَرْبَبْتُاک).

Length in Classical Arabic.

The very short intrusive vowels are not found in classical. The shortest syllable, therefore, consists of a consonant followed by a short vowel; this may be taken as the unit of syllable-length, and we will denote it by ♩; examples: ♩ َءَا ‘and’, ♩ َمَا ‘with’.

Twice as long as this, and therefore represented by ♩, are (a) syllables containing long vowels, such as ♩ َمَا ‘not’, ♩ َفِ ‘in’, ♩ َذَا ‘possessing’; (b) closed syllables (i.e. syllables ending in a consonant), such as ♩ َمِن ‘from’, ♩ َلَا ‘not’, ♩ َكُن ‘be!’, ♩ َکَا ‘in order that’, ♩ َلَو ‘if’, ♩ َغَا ‘foolish’, ♩ َلاَذَا ‘he met’.

The expression َلَا َلَا ‘zajdan ‘but for Zaid’ would, therefore, have the rhythm ♩ ♩ ♩ ♩ ♩. It should be remembered that the first element of a doubled consonant is reckoned as closing the preceding syllable, so that for instance the value of َنَا ‘nassa: is ♩ ♩.

Longer than ♩-syllables are the above types of syllables (a) and (b) when they are followed by the sound ?, especially if this occurs in the middle of a word and not
between two words. Thus the long a in qa:a ‘he came’ is longer than that in la: ?adhab ‘I will not go’, and both are longer than qa: or la: when not succeeded by ?. These increased lengths may be represented by ₰ and ₱ respectively, thus qa:?ahu:, and, la: ?adhab.

Only the most formal reading observes all these proportions. For ordinary purposes it is only necessary to distinguish short ( ₯), as in wa, ?ana ; long ( ₱), as in ma:, ha:l, and over-long ( ₰.), as in qa:a, ḏp:ll.

Examples of different degrees of length.

 qa:huwa ḏdrabak bi- 
 xu:ja:batu ‘waladina:
 (‘Did he strike you with the piece-of-wood of our child?’)

 ḏ ḏ ḏ ḏ ḏ ḏ ḏ ḏ ḏ ḏ illam tasma:na natrukha:
 (‘If she does not hear us, we will leave her.’)

A sentence composed of short syllables. Each one should follow its predecessor with absolute regularity. Beware of the tendency towards lengthening the consonants referred to on p. 59. Practise at first slowly and gradually increase the speed. There must be no pauses whatever between the words.

A sentence of the exactly opposite type, entirely composed of long syllables, each one heavy, unhurried and deliberate. There must be no pauses between the words.
A sentence with mixed quantities. Notice how the voice is entirely cut off after the syllable 'bad, and how this together with the rhythm gives the syllable ?i the effect of belonging to the next word 'ka:na rather than to its own—as though it were fil 'bad, ?i'ka:na l 'kalima.

In this example notice how absolutely necessary it is not to pause between words, but to run straight on (e.g. from ri:hu to tahubbu). Otherwise ri:hu (♩♩) will sound like ♩♩ and the rhythm (and possibly the sense) will be lost. -hu almost seems to belong to the following word (tahubbu) more than to its own; similarly -thu seems to belong to tafa:? more than to hai—as though we were to write ?arri: hutahub bu'hai thuta/fa:?,

Even in these few examples the magnificent sonority and rhythmicality of classical Arabic can be discerned. At each long syllable the voice pauses deliberately; over the short ones it ripples rapidly but without hurry. How effective a succession of long and over-long syllables may sound is exemplified by the following clause from the Korâν, which contains no less than six over-long syllables (owing to glottal stop following a long vowel):

1 Or rather the dot denotes here a quaver rest, to allow for the hiatus.
which portentous sentence only means, however, 'neither to these nor to these'. Another good example is found in the Mohammedan creed:

\[\text{la: } \text{?ila: } \text{ha::?ula:: } \text{?i wala: } \text{?ila: } \text{ha::?ula::?}\]

('There is no God but Allah; Mohammed is the prophet of Allah').

Notice here the hammer-like strokes indicated by the twice-repeated spondaic \[\text{†} \text{†} \text{†} \text{†}\].

Let the caution be once again repeated, and emphatically, that nothing is more fatal (and more fatally easy) than to pause an instant after a word ending with a \[\text{†}\]-syllable (thus virtually prolonging it to \[\text{†}\]): the immediate passing to the next word is absolutely essential. It will be found necessary to practise the junctions between two words quite as much as each of the words separately. For instance, in example No. 4 above, the combination \(\text{h}\)-tahub may have to be practised possibly a dozen times, and similarly \(\text{b}\)-\(\text{i}\), before the sentence runs without pause, stumble, stutter, or other of the forms of boggling which must make any reading aloud (or speaking) a pain to listen to.

**Absence of pause.**

Every clause then must be treated and read as a single unit, as if it consisted of a single word. Each clause must be practised many times if necessary, till this result is reached. No pause must be made, and no final vowel dropped, until the end of the sentence or breath-group.

**Dropping of final vowels.**

At the ends of breath-groups final vowels, if short, not only may but must be dropped. Examples: \(\text{ka:na } \text{fi } \text{bajt}\) (not bajti) 'he was in the house', \(\text{liman } \text{ha:da } \text{bajt}\) (not bajtu) 'whose house is this?', \(\text{ra?ajtu } \text{bajt}\) (not bajta) 'I saw the house'.

1 In Arabic \text{waqf}.
Continuous Speech

Dropping of -n terminations.

The n of the terminations of indefinite nouns (called in Arabic tanwi:n) is also dropped with the vowel at the end of each breath-group, except in the accusative formed with -an, in which case the n is dropped and the vowel lengthened. Examples: ga:?a muḥammad (not muḥammadun) 'Mohammed came', qi?tu bi muḥammad (not muḥammadin) 'I brought Mohammed', but ṭa?aitu muḥammadā: (not muḥammadan) 'I saw Mohammed'. In the case of adverbial expressions ending in -an, however, it is pedantic to apply this rule, thus: ṭa?ānun 'also', rather than ṭa?ān; and so jiddan 'very', ḫa:lan 'at once', etc.

Junction.

We have already shown how each sentence, right up to the pause, must be considered as a single whole, and read as though it were one word. The cementing of the words that compose a sentence is still further secured by the process known as junction (in Arabic wawšīl). It consists in the dropping of the sound ? when initial (together with its vowel) in certain words,1 so that the final vowel of the preceding word runs straight on to the second consonant of the next word. Thus the words for 'by', 'the', pronounced by themselves are bi, ṭal; but when these words are put together they are pronounced bi?l (not bi ṭal). So also we do not say baiṭu ṭal qādil: 'the house of the judge', but baiṭu?l qādil.

The following words and forms have the peculiarity that they lose their ? in connected speech:

(a) the definite article ṭal, including ḥa?il: (= 'The God') and the relative pronouns ḥalil:, etc.
(b) the nouns ḥima? 'name', ḥimri? 'man', ḥimr?ah 'woman', ḥibn 'son', ḥibnah 'daughter'.
(c) the numerals ḥima?a 'two' with its cases and compounds.

1 A glottal stop which may be elided is called in Arabic ḥamsatu 1 woeš ('the glottal stop of junction'). The glottal stop which may never be elided is called ḥamsatu 1 qaṭ, ('the glottal stop of cutting'), because in pronouncing it the voice is completely cut off.
Continuous Speech

(d) the imperative of the triliteral verb, e.g. ?iḍrāb ‘strike!’

e) the past tense, imperative, and infinitive of the VII and following increased forms of the verb, e.g. ?iṭama?a ‘he met’, ?iṭami? ‘meet!’, ?iṭima? ‘meeting’.

Notice in the fourth example the way the voice is completely cut off between 1 and ?i, so that the 1 seems to belong to the previous word. It is most important to make this hiatus correctly; to run the voice on in any way from the 1 to the i is a very serious mistake. Further examples illustrating the same point are ba:jtu_ 1 ?ami:r ‘the house of the prince’, ma:n_ ?ab ‘from the father’, ḫa:n_ 1 ?ax ‘about the brother’, ḫa:la_ 1 ?ord ‘on earth’.

Assimilation of the 1 in ḫal.

When the 1 of the definite article precedes one of the following consonants, it is assimilated to it (see p. 56): t, d, ḍ, n, l, r, d, s, z, ṣ, ḍ. For example, we do not say ḫal tibn ‘the straw’, but atibn, the two t’s being pronounced as a doubled consonant (p. 60). These fourteen consonants are called in Arabic the ‘solar’ consonants; the other fourteen are called the ‘lunar’. Further examples (classical) are the following:

bajtu t tilmi:z ‘the house of the pupil’
nati:jatu t ṭn?qa ‘the result of obedience’
maydu n nil ‘the glory of the Nile’
hudbu ṭ ṭawb ‘the hem of the garment’
quli:lu s sima:? ‘slow to hear’

bi kita:bi d dars ‘with the book of the lesson’
bi ḫalami ḍ ṭurb ‘by the pain of the blow’
fi: baiṭi r ṭayis ‘in the chief’s house’
ṣprilītu ṭ ṭawq ‘good of taste’
sari:?u z zawa:l ‘quick to disappear’
Continuous Speech

\[ \text{makaabbatu} \neq s\ddot{a}di:q \text{ ‘the love of the friend’} \]
\[ \text{jadi:du} \neq r\ddot{u}lm \text{ ‘severe in tyranny’} (\text{jadi:du} \neq r\ddot{u}lm) \]
\[ \text{w\ddot{a}n} \neq f\ddot{a}g\ddot{a}r \text{ ‘the leaves of the tree’} \]
\[ \text{bi lisa:mi} \text{ ‘with the tongue’} \]

**Elision after a word ending in a consonant.**

We have seen that when the previous word ends with a vowel, the vowel is carried over to the next word. If, however, the word ends with a consonant, that consonant is supplied with an additional intrusive vowel, usually i. Examples:

\[ \text{lam j\ddot{u}d\ddot{a}ribi} \neq \text{walad ‘he did not strike the boy’} \]
\[ \text{mina l \ddot{a}nd\ddot{a} ‘from the earth’} \]
\[ \text{\ddot{a}n} \neq \text{i\ddot{a}n} \text{ ‘about the news’} \]
\[ \text{manzilukum}\underline{u} \neq \text{jam\ddot{i}l ‘your fine house’} \]
\[ \text{bi manzilihimi}\underline{u} \neq \text{jam\ddot{i}l ‘in their fine house’} \]

**Elision of \(\ddot{o}\), preceded by a long vowel.**

When junction occurs after a long vowel, the vowel is shortened and runs on to the next word.\(^1\) Examples:

\[ \text{fl l \ddot{a}j\ddot{a}t ‘in the house’} \]
\[ \text{\ddot{u} \neq f\ddot{a}g\ddot{a}:\ddot{a} ‘endowed with bravery’} \]
\[ \text{ma\underline{a}smuk ‘what is your name’} \]

**Elision of \(\ddot{a}\), preceded by a diphthong.**

We have seen (p. 70) that what correspond to diphthongs in classical Arabic are properly aj and aw, rather than ai and au. When these are followed by a word undergoing elision of \(\ddot{a}\), an i is added after the j or w. Examples:

\[ \text{\ddot{u}m\ddot{a}ma l haja:tu \ddot{a}wi: \ddot{l} mawt ‘either life or death’} \]

\(^1\) But the letter denoting prolongation is retained in Arabic writing.
Jasu:nu ?aji_1 masi:k ‘Jesus, orig. ?aj ‘that is’. that is, Christ’

*Elision of ?, preceded by -n termination.*

When a word undergoing elision of ? is preceded by a -n termination (tanwi:n), an i is added after the n.\(^1\) Example: qawwuni_xtartahu ‘a people whom thou hast chosen’ for qawmun ?.ixtartahu. The accusative qawman and genitive qawmin are treated similarly.

*Double elision of ?.*

The following cases arise, when a case of double elision such as (?a)l (?j)qtiha:d ‘diligence’ is preceded by (a) a closed syllable as in juzhir, (b) a long vowel as in juzhiru:, (c) a diphthong as in ?aw, (d) a -n termination as in zaidin. Each of these cases is treated in the same way as when there is only one elision. Examples:

(a) lam juzhiri li_qtiha:d ‘he did not show diligence’ (i added to juzhir)

(b) lam juzhiru li_qtiha:d ‘they did not show diligence’ (long u: at end of juzhiru: made short)
lam juzhiru li_qtiha:d ‘they two did not show diligence’ (for juzhiru:)
fi li_qtiha:d ‘in diligence’ (for fi:)
qobbilu li_bn ‘kiss the Son’ (for qobbilu: ?al ?ibn)

(c) ?al wifdatu ?awi li_ttiha:d ‘unity or concord’ (i added to ?aw)
?al wifdatu ?aji li_ttiha:d ‘concord, that is, unity’ (i added to ?aj)

(d) haqqani li_ttiha:du hasan ‘verily unity is good’ (i added to -n termination)
?axa:da muhammaduni li_?nain ‘Mohammed took the two’ (for muhammadun, ?i?nain)
?innama bi zaidini li_ttiha:d ‘only through Zaid is unity’ (for zaidin)

\(^1\) This n though sounded is not written in Arabic writing.
There is no limit to the number of words undergoing elision of ? that may succeed each other, and are therefore read off as though they constituted a single word. The following example contains seven cases of elision of ?:

?inna lla%i:na st%ns%ru ṭṭ%:ha s sami:qar a l ḥaki:m a
ftudu ftida?qa: 'Verily they-who appealed-to Allah the Hearer, the Wise, were redeemed greatly'.
CHAPTER XI

READING ALOUD (Literary Arabic)

It goes without saying that fluency in speech demands complete control of all the Arabic speech sounds in all positions. Such control can only be acquired by hard practice. In early stages a few sentences of a connected classical text should be specially studied and memorized by sheer repetition in private. By the end of the week the whole piece should be so perfectly master ed, that it can be slipp ed off the tongue almost without thinking. The colloquial language demands similar methods and equal pains.

Only by thus aiming at and practising fluency can the new muscles involved be trained, and the new positions which are demanded by the new language for the tongue, lips, &c., become easy and natural. An immense amount of stiffness and awkwardness, which produces stuttering, pausing, mispronunciation and inequalities in speech, has to be got rid of. It can only be got rid of by hard practice; it is practice alone that can familiarize the directing brain and executing vocal organs to the new lines of activity which are being opened out, especially as these new lines cross the old lines in the most confusing and troublesome fashion.

A loud voice should under all circumstances be used, both in practising isolated sounds and continuous sentences. To begin with, boldness is a sine qua non in Arabic reading, reciting, and speaking. Secondly, phonetic and other mistakes are far more easily detected and remedied when one is pronouncing in a strong and bold voice than when one is using a low mumbling voice.

If the student, while working through the preceding chapters, has been simultaneously studying the elements of Arabic grammar,¹ he will be in a position to begin con-

¹ We cannot here discuss the question whether a student should begin with the classical or the colloquial. Both ways are possible.
secutive reading aloud of some book. We now give some closing hints in regard to the art of reading Arabic aloud.

For practising reading aloud it is best to begin with the Arabic translation of some book the original of which is well known to the reader. Of all books, the gospel of St. John is particularly suitable for this purpose, both because of its familiarity and because of the simplicity of its construction and vocabulary. Later on the student may proceed to other books, newspapers, &c. The finest practice of all is poetry.

We remind the student once more that the sentence is the unit. Within the breath-group there must be no pause and no hesitation. This fact is of fundamental importance. It is better to drop short vowels occurring at the ends of words altogether than to stress such vowels or dwell on them or pause after them; in fact, as will be seen, there are styles of reading in which it is perfectly legitimate to drop them.

To gain the desirable fluency and rhythmic swing, reading aloud must be most assiduously studied, and every reading-lesson should be both preceded and followed by hard private practice. Personally, the writer found that intoning passages is a most valuable aid to reading, especially in private practice.

*Styles of reading.*

The style of reading referred to in the preceding chapter and in Chap. VII is what may be termed a fairly 'high' style. Students who have no notion of becoming Koran readers may object that the above-mentioned system is altogether miscalculated. As a matter of fact Koran reading as practised by the trained readers involves very many more rules than have been even hinted at in this book. Fundamentally the principles laid down in this book are not special but general; and, though they may be often relaxed, yet they have to be learned and mastered before they can safely be thus relaxed.

In certain by no means out of the way cases, all the
Reading Aloud 85

principles and rules laid down in this book will have to be strictly observed, e.g. in the reading of all Arabic poetry. There is nothing that gives better practice for all reading than to work away at a dozen lines of Arabic verse. It is the final test of Arabic reading and delivery in general.

Then it is to be noticed that the more perfect the student’s mastery of the above principles becomes, and consequently the less effort the carrying out of them involves, the more easily will he be able to read in the ‘high’ style without any appearance of pedantry, in fact with the appearance of absolute simplicity. This is the final goal to aim at—a style that will, at the same moment, neither puzzle the uneducated hearer, nor offend the educated, but please both equally.

For example, in the sentence ?ala: jafhamu zajdan? ‘does he not understand Zaid?’ it will be said by some that the u of jafhamu should be dropped in ordinary reading, (1) because the insertion of it is pedantic, (2) because the uneducated hearer hears jafhamu:, and mistakes it for the plural with which he is familiar (i.e. he hears ‘they understand’ instead of ‘he understands’).

Both objections are perfectly valid for readers who are unable to attain to a perfect style. Such, undoubtedly, should read jafham. But it is just because the art has not been learned well enough, because, owing to the want of fluency, that u is not given its right value, that the word either sounds pedantic or is mistaken for jafhamu:. Read properly, the u pleases the educated ear, and passes unnoticed by the uneducated hearer.

It would be arguable that, with sufficient knowledge and art, every single vowel of classical speech could be maintained and given its value, even in simple reading. But there is no reason to deny that ‘lower’ styles of reading are possible, and usually advisable.

We may distinguish the following grades:

(1) Reading poetry and the Koran, and, in general, reading in public on very formal occasions: no easing off of any of the principles referred to in the preceding chapter.

(2) Reading on somewhat less formal occasions: -n terminations (tanwīns) may often be dropped, and final vowels
may often be reduced to ə. \(^1\) Junctions may often be suppressed. Words like bajt, mawt may be changed from these stilted forms to be:t, mo:t (see p. 42), &c.

(3) Reading newspapers, &c., to friends: a style between the last and the following.

(4) Reading to very uneducated people, especially to women: as many concessions as you please to their habits of speech in respect of vowels, not only in terminations but also in the body of words.

Only experience and practice can suggest where to relax the rules of the ‘high’ style, and only experience and practice can carry out the suggestions without hesitation. This calculated inaccuracy is as much an art as accuracy itself.\(^2\)

**Hints on learning to read aloud with a teacher.**

Concentrate on a short piece during each lesson, and aim at learning it perfectly. Straight-ahead reading with a teacher is not to be encouraged until a very advanced stage.

Let the teacher take the lead at first and read the piece through once. Then repeat it after him, word by word, short clause by short clause, breath-group by breath-group, repeating as many times as is necessary to correct mistakes in consonant, vowel, word, breath-group, or in the rhythm.

Then go over it again and again, gradually taking longer and longer portions at a time, until you can finally go over the whole piece by yourself.

After each lesson, prepare by going over and over the passage just studied. Begin the next lesson by revising the same with the teacher.

\(^1\) Examples: bait, el qa:di for \{ baitu 1 qa:di \\
\{ baita 1 qa:di \\
\{ bašt 1 qa:di \\
\{ nisbatu 1 haqq \\
\{ nisbata 1 haqq \\
\{ nisbatI 1 haqq \\
\{ kala:mu n nafs \\
\{ kala:ma n nafs \\
\{ kala:mi n nafs

It must, however, be pointed out that the reduction of vowels to ə is a dreadfully insidious habit, and is apt to become the master of the reader, instead of the reader being the master of it.

\(^2\) Some guidance is given in the pages immediately following.
Dictation is a necessary exercise for ear-training and should be done frequently. Use at first pieces you have already read; then pieces you have not read, but taken from a book you have begun to read; finally, pieces out of some quite unfamiliar book. Dictation should continue until mistakes become exceptional.
CHAPTER XII

SPECIMENS FOR READING

FROM THE ARABIC GOSPELS

St. John 5.

The first line gives the fully-vowelled classical version. Hardly any but Azharite Ulema read quite like this. The second line shows how a man reads who is keeping to the classical but is trying to simplify as much as possible without 'becoming colloquial'. Naturally there are different possible gradations between these two, and no two readers will read quite alike. The third line gives a purely colloquial version.

N.B.—The sign * indicates a length that is less than twice a short vowel.

1. And after this was a feast of the Jews, and
   wa baʃda haːdaː kana qid dun lil jahudi fa
   wa baʃde haːzeh kaːn qid lil jahud, fa
   wi baʃdi da kan qid lil jahud, ?am
   went up Jesus to Jerusalem. 2. And in Jerusalem

the keeping of them, and He is the Exalted the Mighty.
ḥifduhuma: wa huwa_1 qalijju_1 ẓūdī:mi.

3. Sura 105.

This early Sura exhibits well the typical rhyming-system of the Koran.

Didst thou not see how wrought thy Lord with
ʔalam tarq kajfa saʃala ṭubbuka bi
the owners of the Elephant? Did he not turn their stratagem
ʔaṣha:bi_1 fi:1? ʔal ʔal jaʃal kajdaḥum
to confusion, and sent upon them birds in flocks,
fi: ṭaʃli:1, wa ṭursala ṣalajhim ṭnjo:n ʔaʃa:bi:1,
to pelt them with stones of baked clay; and made them
ʔal tarmi:him bi ʾiша:roṭin min siyj:_1; ʔaʃaʃalahu

even as corn devoured?
ka ṣasīn maʔku:1?
The following three verses show the obscure vowelling of the five ārafa: muqala. (see p. 53, n.), viz. b d ṣ q when in close.

Praise to Him who conducted His servant by night
(1) subha:na: illā: bi ṣab’dihi: lajlan
from the Mosque the Sacrosanct to the Mosque the Farthest!

Gardens of Eden, running from under it the rivers.
(2) jannah tu ḥad’inn tař’ri: min taḥtiha: l ?anha:r.
'O thou soul tranquil! return to
thy Lord well-pleased, well-pleased-with: then enter among
raḥbiki ṭa:ṭiṭan marḍijjah! fa_d: xuli: fi:
my Servants and enter my Paradise.
ṣiba:di:, wa_d: xuli: jannah:.

Arabic Poetry.

(a) Classical.

In reading poetry aloud, the more absolute the ratio  is kept, the finer will be the effect. And that for a very special reason: the tone-accents as often cross the ictus of the rhythm as they coincide therewith; so that the only thing that creates and preserves the rhythm of the metre is the quantity of the vowels. Ancient Greek poetry was probably similarly characterized, i.e. the tone-accent system of the language was quite independent of the quantitative system; and therefore poetry, retaining the former, depended on the latter to maintain rhythm and give effect to metre. In Modern Greek the stress-accents have overmastered the quantitative system of the vowels, just as they have in colloquial Arabic; and it is this—the destruction of the quantitative relations combined with the preservation of the stress-accents—that turns Classical Greek poetry into prose.
when read à la Modern Greek. Similarly, therefore, Arabic poetry loses its distinctive poetic rhythm unless the quantitative relations of the vowels are meticulously preserved.

In the following examples (taken from the Arabian Nights) the sign | marks the division between the feet (often, of course, occurring in the middle of a word); the sign || marks the end of a half-verse; and || marks the full-close, and rhyme, of a completed verse.

1. Metre 'al-kamîl'. The basic foot is \( \text{\textbullet} \text{\textbullet} \text{\textbullet} \text{\textbullet} \), with \( \text{\textbullet} \text{\textbullet} \text{\textbullet} \text{\textbullet} \) interchangeable with first \( \text{\textbullet} \text{\textbullet} \text{\textbullet} \text{\textbullet} \).

Yield thine affairs to the Kind, the Wise One,
'sallim ?umu:rkà lîl ɪptɪ:ʃl ʔalîmi: ||

and ease thy heart from all the World;
wa ʔarîh fu:a:dakâ min ʒâmiːjîl ʔalâmiː ||

and know that the affair is not as thou wilt,
wa ʃlâm bi?an刷卡 ʔamar lajša kama: tɑːː ||

but what He wills, Allah, the wisest Ruler.
bal ma: jâːʃu ʃr:hu ʔaːkamû ʔaːkímiː ||

In the second line, for example, the tone is on ʔa, which is the weakest and least important syllable of all from the viewpoint of the metrical rhythm, being 'on the up-beat'. The rhythmical beat falls on the very next syllable riḥ, which being closed is considered 'long'. But the quantity of ʔa is kept quite short and the rhythm is sustained by giving full value to riḥ, which, in the present instance, means that the closed ʰ must be articulated deliberately, so that the syllable riḥ will take fully as long to articulate as would ri:.

It should be said in this connexion (1) that in reading poetry

---

1 The classical prosodists talked of vowels being 'long by nature or by position'. The Arab prosodists said that; and a consonant terminating a syllable are equivalent in value. Both meant one and the same thing.
the tone-accents are probably kept subdued, compared with prose or speech, so as to give quantity a better chance:

(2) that it is considered very school-boyish to transfer the tone-accents to the rhythmically important beats, so as to bring out the metre more strongly. In the above example the ictus of the metre being $\text{♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩ Carlton Ford

instead of

wa-ŋa-riŋ fu-ŋa: - da-ka

Yield the matter to the Lord of mankind, 'sallimi 1 'am|re |'ila: rob|bi 1 'basar ||

and leave care and cast away anxieties;
wa|truki|l 'ham|ma wa|daq: 'jan|ka 1 'fikar ||

do not say of what happens 'How happened it?'
la: 'taqul fi: | ma: 'qar\d: |'kaj|fa 'qar\d: ||

Every thing is by Decree and Determination.
kullu 'faj\i:n | bi q\a|\d:?in | wa 'q\o|\dar ||

3. Metre 'dt twi:1'. Basic feet

$\text{♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♪♩♩♪♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩♩ Carlton Ford

with alternatives as indicated.
Specimens for Reading

Yea though I attained to all favour, walaw ʔan]|ija: ʔds|ba|tu fl: ʔkul|li ʔni|m|at|in ||

and though I had the world and the realm of the Caesars, wa ka|nat |li|ja_d ʔ|unja: |wa _mulk_1 ʔa|ka:sir|p: ||

it would not equal, to me, the wing of a gnat lama: ʔsa|wi|jat ʔj|indi: |gana:ka |bah|u:ʔ|tin ||

if were not my eye upon thy person gazing. ʔ|ida: lam |takun ʔaj|ni: |li ʔax|si ka na:z|ir|p: ||

The first foot of the third verse affords an excellent example of total non-correspondence between tone-accent and metrical rhythm. The metrical rhythm is ḫ sound; but it so happens that both the short beats are accented with voice-pitch, while the one strong beat has no accent at all. Obviously the only way to give the metre and the rhythm a chance is to give fullest quantitative value to the second syllable, while keeping the first and third short, though toned, thus:

lam:a: ʔa-|wi|-|jat ʔj|in|-|di

4. Metre 'al mutaq|rifb'. Basic foot ḫ, with alternative as indicated.

Surely hath written Time the excellence of generosity. la|q|d ʔa|taba_d dah|ru fɔ|da|l_1 | karon ||

But thy goodness up to now is not chronicled. wa fɔ|دل|ka lil ʔa|na la: juk|tatab ||

Then may not orphan Allah from thee mankind!

fa la:_ ʔa|tam|p_ t̪ˤ|pu minka _l | war|p: ||

For thou art to goodness mother and father.

li ʔan|na|ka lil fɔ|d|li ʔummun | wa ʔab ||
5. **Metre 'al basīṭ**: Basic feet

\[ \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \quad \text{\textbullet \textbullet} \]

with alternatives as indicated.

If knew the house him who hath visited it, it had rejoiced, law taʔlamuʔ ḍ | dāːru man ṣaquḍ ṣūraḥaː | fariḥaṭ ||

and congratulated itself, yea and kissed the place of his foot-step, wa ṣafṣafīt ṣumma baːsat mawdaːʔaːl qodamiː ||

and had sung by the tongue of its state, saying, wa ṣanaʃadat bi lisaːni ṣｯaːli qoːʔilatan ||

'Welcome thrice welcome to the man of bounty and liberality!' Ḍaḥla ṣahlaːn bi ṣaːliː quːdi waːl karaːmiː ||

(b) Colloquial.

The best colloquial verse can be scanned as definite and regular metre, following the general laws of Arabic prosody, provided that it is read in accordance with the principles of colloquial speech as systematized on pp. 68-72. It is unnecessary to point out what a complete verification this fact constitutes of the correctness of those principles themselves. The composer of the following satirical verses, for example, was not consciously following these principles. He was just writing as he naturally spoke, and he was following a metre, which, therefore, cannot be scanned unless our speech is as his. This shows that the elisions, &c., of colloquial speech are essential, not optional, and so are necessary if our speech is to be the language of talk, and not something which is neither that of talk, nor of writing, nor anything else.

**Metre** (almost identical with the Classical 'sariːq' or 'rığaz'):

\[ \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \]

or \[ \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \quad \text{\textbullet} \]
1. ṭahlan wa saḥlan ja bafir ʾil hana: ||
   Welcome right welcome, O evangelist of joy

2. ṭalif habili ṣamaḥ bi l wispa: ||
   Apostle of my Beloved, who has permitted union!

3. ṭareti ṭalam nafṣuhi wīnuṭti ṣina: ||
   I have recited ‘Have WE not expanded’, and obtained my desire;

4. wī l hammizal wī l ḥuzni ṣaṭ l ṣa l qiza: ||
   And anxiety went, and grief removed its furniture.

5. balaqti ṭaliti wī l ṣazal ṣintaḥar ||
   I have reached my purpose and the Censor has committed suicide.

6. zaman gōz ummi kan da jī ni kitir ||
   long my stepfather has annoyed me greatly

7. wī hijja kānit minnu ṭalibā ṭalat: ||
   while she too was from him demanding divorce

8. u kutu ana fū l ṣumri lisqa ṣagir ||
   and I was, I, in age still a minor

9. wī kunna daimon fī nizaf wī f xina: ||
   and we were ever in dispute and in quarrel

10. wī l ṣesā kānit ṣesit gūm mi w kadār ||
    and life was a life of sullenness and trouble.

Notes

The above represents two stanzas of five lines each. The rhymes are alternate, except that all the fifth lines rhyme together throughout the ode.

Line 2, foot 1. ṭ: shortened to ṭ before lṭ.

Line 3, foot 1. or ṭareti ṭalam, with loss of the glottal-stop. This would be regular: only here ṭalam nafṣuhi is a quotation from the Qur’a:n (supply, ‘thy breast’).
Line 4, foot 1, 2. Note supply of intrusive vowels, without which the metre is lost.

Line 6, foot 1. ma: > ma before ng; 'qo: > go through loss of accent; ummi loses its glottal stop, regularly.

Line 6, foot 2. ka: > ka before nd; 'da: > da owing to loss of accent.

Line 7, foot 2. təlba, from tə:liba, according to rule. Similarly daiman for da:ʔiman in line 9.

Line 9, foot 3. wi f for wi fi, according to rule.

Line 10, foot 3. mi wi > mi w, according to rule.

Exceptions to these colloquial principia are reminiscences of the literary language due to 'poetic necessity' (fənru:rit if fiːr). Otherwise in line 6, foot 3, we should have to say ni ki:r; line 8, foot 1, we should have to say ana, not ana:.

In line 10, foot 2, qaːʃit can only be a metrical blunder of the poet himself. The syllable ŋit should imperatively have been a short open one (”).
